SEVENTEENTH ANNUAL REPORT

OF THE

CHIEF OF THE CHILDREN'S BUREAU

UNITED STATES DEPARTMENT OF LABOR,
CHILDREN'S BUREAU,
Washington, September 16, 1929.

Hon. JAMES J. DAVIS,
Secretary of Labor.

SIR: I have the honor to transmit herewith the seventeenth annual report of the Children's Bureau, for the fiscal year July 1, 1928, to June 30, 1929.

During the past year the work of the Children's Bureau has continued along three general lines: (1) Scientific studies of child health, child labor and vocational guidance, recreation, dependency, delinquency, and neglect; (2) cooperation with State departments of health under the maternity and infancy act in the development of an educational program for the promotion of the health of mothers and babies and with State departments of public welfare in the collection of information regarding children who are physically, mentally, and socially handicapped; and (3) preparation and distribution of popular material on maternal, infant, and child care and other subjects. For the carrying on of this work the bureau is organized into seven major divisions: Maternity and infant hygiene, child hygiene, industrial, social service, statistical, editorial, and general administrative.

MATERNITY AND INFANCY

Administration of the maternity and infancy act.

With the close of the fiscal year 1929 Federal and State cooperation in promoting the welfare and hygiene of maternity and infancy under the act of November 23, 1921, came to an end. In extending by two years the original 5-year period for which appropriations were authorized, Congress declared in January, 1927, that after June 30, 1929, the act should be of no force and effect. During the fiscal year 1929, 45 States and the Territory of Hawaii were cooperating with the Children's Bureau in accordance with the terms of the act. The legislatures of three States—Connecticut, Illinois, and Massachusetts—have never accepted the aid offered by the Federal Government.

The following table gives the amounts available and the total amounts accepted by the States from the appropriations for the fiscal years 1922 to 1929, inclusive. Except for the year 1929 the annual appropriations were available for 2-year periods. The amounts accepted from the 1929 appropriation are for this reason somewhat less than the amounts accepted from the 1928 funds.

TABLE 1.—*Amounts available to States and Hawaii from Federal maternity and infancy funds and amounts accepted* [1]

States and Territory cooperating	Maximum amounts available from 1922 appropriation [2]	Amounts accepted by States from 1922 appropriation	Maximum amounts available from 1923, 1924, 1925, 1926, 1927, 1928, and 1929 appropriations	Amounts accepted by States and Hawaii [3] from—						
				1923 appropriation	1924 appropriation	1925 appropriation	1926 appropriation	1927 appropriation	1928 appropriation	1929 appropriation
Total	$477,500.00	$316,554.02	[3] $1,201,725.96	$716,333.40	$877,122.04	$932,754.69	$947,959.59	$957,458.84	$957,470.29	$792,120.24

[1] Under the terms of the act each State accepting receives $5,000 outright; an additional $5,000 is available to each State if matched; the balance of the appropriation is distributed among the States, if matched, on the basis of population. Amounts shown are the amounts actually accepted by the States up to Jnne 30, 1929, less refunds of unexpended balances returned to the Federal Treasury as of Sept. 30, 1929.

[2] Owing to the fact that only a few months of the 1922 fiscal year remained at the time the appropriation act for that year was passed a full appropriation was not made.

[3] The benefits of the act were extended to Hawaii on Mar. 10, 1924. No appropriation therefore was available to that Territory in 1923 and 1924. The total amount available to the States in each year from 1923 to 1929 has been $1,190,000.

[4] California and Illinois accepted the full amount available, and Vermont accepted $5,000. However, these funds were not spent but were returned to the Federal Treasury.

An analysis of the reports received from the cooperating States has been published each year by the Children's Bureau.[1]

The reports of the 45 cooperating States and the Territory of Hawaii briefly summarized show the following activities for 1929: The total number of child-health conferences conducted by physicians in 44 States and Hawaii was 16,933. In all the cooperating States there were 2,352 prenatal conferences and 6,198 combined prenatal and child-health conferences. The babies and preschool children brought to conferences by their parents numbered 213,015. The number of expectant mothers who came for instruction in prenatal care was 11,829.

The 394 public-health nurses detailed to counties for full or part time maternity and infancy work, together with nurses on the staff of the State departments, reported 674,083 home visits. The number of conferences held and children examined by members of the State staff, is relatively smaller in States that have adopted the policy of using a considerable portion of the funds for subsidies for county and other local organizations with a view to getting the work on a permanent locally supported basis.

The number of expectant mothers who attended the conferences, or were reached by classes, home visits, prenatal letters, and correspondence courses and literature distributed, was almost 200,000. The number of infants and preschool children reached through conferences, instruction of parents, and home visits and literature distributed was almost 1,290,000. Many other mothers and children were reached through literature, but some States made no report on the number reached through this method. It is the practice in many States to send birth-registration certificates and publications on the care of the baby to parents of all babies whose births are registered in the State department of health.

During the year under review 65 combined prenatal and child-health centers, 127 child-health centers, and 19 prenatal centers—a total of 211—were established. In many instances these were sponsored by and became a permanent responsibility of the local community. Since the beginning of the work under the act 161 counties and 13 communities have assumed responsibility for maternity and infancy work begun with the State or Federal maternity and infancy funds. In addition, 36 counties assumed this responsibility after the close of the year and 54 communities prior to or at the close of the year.

During the year ended June 30, 1929, the medical and nursing staff of the Children's Bureau visited 17 States and the Territory of Hawaii to confer with State administrators and review types of work carried on. The bureau accountant audited Federal accounts in 45 States, and the Territorial accounts of Hawaii were audited by a member of the staff who visited the islands.

On request staff details have been made to 17 States for special work. Examples of this are the assignment of the colored physician on the staff of the maternity and infant-hygiene division to organize classes for colored midwives and assist in birth registration in three States. A demonstration of the work to be done by a

[1] The Promotion of the Welfare and Hygiene of Maternity and Infancy—[Report of] The Administration of the Act of Congress of November 23, 1921, for the period March 20, 1922, to June 30, 1923, and the fiscal years 1924 to 1928. U. S. Children's Bureau Publications Nos. 137, 146, 156, 178, 186, and 194. Washington, 1924–1929.

county maternity and infancy nurse was made in a Rocky Mountain State. During the year bureau physicians were detailed to 11 States at the request of State health departments to assist in studies of maternal mortality. In one State a member of the bureau's obstetrical advisory committee conducted four district institutes for doctors. Arrangements were made for these institutes by the State departments of health, and the State and county medical societies. As in previous years, assistance was given to States not in the birth-registration area, in their campaign for state-wide registration. By the close of the fiscal year 1929, 45 States and the District of Columbia had been admitted to the birth-registration area.

Infant and maternal mortality in the United States.

For a number of years the general trend of infant mortality in the United States birth-registration area has been downward, though marked by occasional rises in rates due to epidemic or other causes affecting adversely infant health and also to the expansion of the birth-registration area by the admission of new States with high death rates.

In 1927, in the birth-registration area comprising 40 States and the District of Columbia, 65 babies out of every 1,000 born alive died during their first year. The lowest previous rate for the area was 71 in 1924. Prior to that year there had been no rate lower than 76. In 1928 the rate for all the 44 States in the area was 69, showing that, although higher than in 1927, the rate is now fluctuating around a different and lower level than formerly.

In 1922 six countries for which comparable statistics were available had a lower infant mortality rate than the United States birth-registration area—Australia, the Irish Free State, New Zealand, Norway, Sweden, and Switzerland, while the rate for England and Wales was practically the same as for this country. Although official figures were not available, the Netherlands undoubtedly had a lower rate than the United States at that time. The latest available figures for Norway, Sweden, the Netherlands, Australia, New Zealand, and Switzerland still show infant mortality rates lower than the American rate, in spite of the reduction made in this country. Oregon with a rate of 47 in 1928, which was the lowest rate for any American State, Washington with 48, and Nebraska with 53 have lower rates than any country for which comparable statistics are available except New Zealand, which reduced its rate from 48 in 1921 to 40 in 1926. It should be noted, however, that it will be more difficult and probably will require more time to lower the present United States rate than was required to decrease the rate for the birth-registration area 17 points—from 86 in 1920 to 69 in 1928. In other words, it is easier to correct conditions generally bad than to make further improvement in a good program. In the latter case a study of the local causes of death and a careful adaptation of the program to solve ascertained local problems is necessary.

Maternal mortality has not shown a downward trend similar to that for infant mortality, yet some reductions have been made. Comparison of the maternal mortality rate for the expanding birth-registration area of 1922 with the area of 1927 (the latest available figures as this report goes to press) shows little change, the rate being 66 per 10,000 live births in 1922 and 65 in 1927. In the rural areas, however, where work under the maternity and

infancy act was especially promoted by the States, the rate dropped from 59 in 1922 to 55 in 1927. This reduction has been obtained in spite of the addition of States with high rates to the birth-registration area and the classification of more deaths as due to puerperal causes which has resulted from the more careful scrutiny, in recent years, of death certificates of women of child-bearing age on the part of State divisions of vital statistics and the United States Bureau of the Census.

If the States that were in the birth-registration area each year from 1922 to 1927 are considered, the reduction in the total maternal mortality is greater—from 65 deaths per 10,000 live births in 1922 to 62 in 1927. The program of education of expectant mothers in the importance of prenatal care is reflected in a reduction of the puerperal deaths from albuminuria and convulsions, due to earlier detection of symptoms of these conditions. The rate from this cause in the States that were in the area in both years was 18 per 10,000 live births in 1922 and 15 in 1927.

Local organization for child-health work as a result of the maternity and infancy work.

A review of the annual reports of the States shows a great expansion and improvement in the child-health work being done by the States and by local units of government—county, city, and town—since 1922.

The work of health departments in sanitation, control of communicable disease, inspection of milk and other foods—fundamental in a health program for both adults and children—was formerly regarded as all that the public needed for the promotion of the health of mothers and babies. But, as private infant-welfare societies demonstrated both in the United States and in Europe, the way in which infant mortality could be reduced most promptly and the general health of children safeguarded was by organized provision for the education of parents, especially mothers, in the scientific care of their children. Appreciation of the need of public organization for supplying these educational services began to develop. Before the Children's Bureau was established in 1912, one State and several of the largest cities had created bureaus of child health in their departments of health. These were the first public agencies to recognize that in addition to the general organization for health work a special organization on the basis of age is necessary to safeguard the health of children. These new divisions did not take over any of the work that promoted the general health of the community. Their activities were in addition to the general health work of the departments and had for their object the education of parents, primarily, but also teachers and the general public, in the principles of child care. Since general principles must be modified to meet the need of the individual child, the child-health center or conference where the mother is instructed by the doctor and the nurse in terms of the needs of her own child, as well as mothers' clubs and classes and books and pamphlets on infant care and child health, is used in this educational program.

The cooperation with the women's organizations begun by the Children's Bureau with its creation in 1912, especially in the activities inaugurated during the Baby Weeks and Children's Year begun

in 1916 and 1918, as well as the distribution of popular literature and films, greatly increased interest in child health. As a result child-health divisions were created in an increasing number of States and cities, particularly in 1919. However, these State divisions or bureaus of child health, with the possible exception of New Jersey, were provided with such inadequate funds that before 1922 they had been able to do very little more than general educational work as to the importance of child health. In that year the maternity and infancy act, by providing Federal funds and stimulating larger State appropriations and, even more important, by greatly increasing public interest in this whole subject, put the work on a new basis. In most States the funds have been adequate during the past seven years to provide a small qualified staff for the State department and to assist local communities by demonstration or subsidy in developing their own work, so that educational services have been made locally available to mothers where no organized work had been done before.

In States which had adopted the policy of promoting full-time county health units, the Federal and State maternity and infancy funds were used to add a child-health program to the work of the county health units which had already been established, and in counties which had not adopted the county health unit organization, the maternity and infancy funds which could be used for local subsidies for this part of the work induced some county boards to make the necessary appropriations for general health work. In 361 counties in 28 States, the State and Federal money has provided during the past year one-sixth, one-third, or one-half, to, in a few, the full cost of a county nurse, a local child-health center, or other activity, while the local community paid the balance. As the complete support of many similar cooperative undertakings in previous years has been taken over by the counties, the State and Federal funds have been released for assistance in other local communities. Of the 211 permanent centers established in 1929, 123 were entirely and 63 were partly supported by local funds.

While the extent to which the organization for the promotion of child health has been put on a permanent basis in so short a time is remarkable, the work has only been begun. A great expansion instead of curtailment of the program is now called for. County organization of these services on a nation-wide basis is needed. In some States the work has hardly been started. In States with a number of full-time county health units in which a small maternity and infancy service has been organized many of these units are now ready, with some help, to extend the work.

Although the promotion of the health of children is frequently said to be a function of the State or local government, no subject is of greater importance to the National Government than the health of its children. Withdrawal of Federal cooperation at this time is certain to mean great national losses if healthy children are counted a national asset.

State appropriations for continuing the maternity and infancy work.

Will the States carry on this joint work unaided by the Federal Government so that there will be no loss to the mothers and babies? Can we expect the expansion of programs on the basis of the demonstrated successes of the last few years without Federal assistance?

Nation-wide interest in this problem of the health of mothers and babies has been almost as important in promoting the work as the money contribution, but funds are essential if gains that have been made are to be conserved and extended. When the Federal maternity and infancy act came to an end every effort was made by its supporters to secure State appropriations equaling at least the combined Federal and State funds that were expended last year. This effort for increased appropriations was made in order to continue the work that was being done and also because in the event of the enactment of a law continuing Federal cooperation the increased appropriation would make possible an expansion of activities along the lines that experience had indicated were desirable.

Fifteen States and the Territory of Hawaii report that their legislatures have appropriated an amount equaling the combined Federal and State funds of last year. In some of these the appropriation was made because the women of the State requested it in such overwhelming numbers that refusal seemed impossible. These States in which the work will continue without interruption are: Delaware, Maine, Maryland, Michigan, Missouri, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, South Dakota, Tennessee, Vermont, and Wisconsin. In addition, California has appropriated an amount equaling the State and Federal appropriations in 1929, but this appropriation is for the first year only of the biennium for which appropriations are usually made. In Florida the support for the work comes from a millage tax for the health departments, and the State reports that it expects the returns will enable it to expend an amount equal to the State and Federal funds for maternity and infancy work this year.

In five States—Indiana, Minnesota, Montana, Pennsylvania, and Texas—the legislatures made appropriations which represent large increases over the previous year but do not quite equal the amount of combined State and Federal funds which the States had under the maternity and infancy act. The legislatures of seven States—Georgia, Kansas, Ohio, Oklahoma, Rhode Island, West Virginia, and Wyoming—made appropriations which represent increases over State appropriations for the previous year but are considerably less than the combined State and Federal funds for 1929.

In six States—Arkansas, Colorado, Iowa, Nebraska, Oregon, and South Carolina—the appropriations are the same or less than the State appropriations for 1929, so that the work will be greatly curtailed. Two States—Nevada and Washington—made no appropriations for carrying on the work.

In Arizona, where the legislature made an increased State appropriation, and in Utah, where the appropriation is the same as in the previous year, the State funds may be spent only if Federal funds are available. In Idaho no State funds may be spent after December 31, 1929, unless Federal funds are available.

In Kentucky, where the State appropriation for the second year of the current biennium was vetoed by the governor, private funds have been provided practically equal in amount to the State appropriation.

The legislatures have not met this year in Alabama, Kentucky, Louisiana, Mississippi, and Virginia.

The threat of withdrawal clearly acted as a two-edged sword, stimulating some States to greater expenditures and influencing others to reduce the work if the Federal Government withdrew. In a third of the cooperating States the money appropriated is sufficient to continue the present activities; in the others doctors and nurses will have to be dismissed and cooperative arrangements with counties and local communities will have to be curtailed unless the Federal Government continues to promote the health of mothers and babies through some sharing of the expense involved.

Study of maternal mortality.

An investigation of every registered maternal death during the calendar years 1927 and 1928 in 13 States and in 2 States for 1928 only, is practically completed. This investigation was first outlined by the chairman of the bureau's obstetrical advisory committee [2] at the 1926 conference of the State directors of maternity and infancy work. It has been conducted under the general supervision of the bureau's obstetrical advisory committee, in cooperation with State departments of health and the State medical societies in Alabama, California, Kentucky, Maryland, Michigan, Minnesota, Nebraska, New Hampshire, North Dakota, Oklahoma, Oregon, Rhode Island, Virginia, Wisconsin, and Washington.

Preliminary reports of findings for the puerperal deaths in 1927 were given to medical groups in Maryland and Nebraska. Tabulations were made of certain points of the schedule for the 2,650 puerperal deaths which occurred in 1927 in 12 States, for use by the secretary of the section on obstetrics, gynecology, and abdominal surgery of the American Medical Association, who is also a member of the Children's Bureau consulting obstetrical committee, at the meeting of the American Medical Association in Portland, Oreg., in July, 1929.

This preliminary count showed that the pregnancies of more than one-third of the mothers who died in these 12 States had terminated before the seventh month, the period at which the child has a chance of living, if born. Twelve per cent of all the maternal deaths followed abortions that had been induced. Of the 328 women in these 12 States who were reported to have died following induced abortions, more than four-fifths were married.

These deaths following premature termination of pregnancy are of particular interest in considering deaths due to puerperal septicemia, or what is commonly referred to as childbed fever. Of the eight main causes under which puerperal deaths are classified, puerperal septicemia is the most important, accounting for about 40 per cent of all puerperal deaths in the United States. It was hoped that this study would throw some light on the underlying

[2] The members of this committee are Dr. Fred L. Adair, Minneapolis, Minn., professor of obstetrics and gynecology, University of Minnesota Medical School; Dr. Robert L. De Normandie, instructor in obstetrics, Harvard Medical School, chairman; Dr. Rudolph W. Holmes, professor of obstetrics and gynecology, Rush Medical College, University of Chicago; Dr. Ralph W. Lobenstine, New York City, chairman, medical advisory board, Maternity Center Association, New York; Dr. Frank W. Lynch, professor of obstetrics and gynecology, University of California Medical School; Dr. James R. McCord, professor of obstetrics and gynecology, Emory University School of Medicine, Atlanta; Dr. C. Jeff Miller, professor of gynecology, Tulane University of Louisiana School of Medicine, New Orleans; Dr. Otto H. Schwarz, professor of obstetrics, Washington University School of Medicine, St. Louis; Dr. Alice N. Pickett, assistant professor of obstetrics, University of Louisville School of Medicine, Louisville.

cause of this group of deaths. Of the 1,076 deaths in the 12 States found on investigation to be due to puerperal septicemia, 46 per cent followed abortions, and 27 per cent followed abortions that were induced intentionally. Abortions, therefore, were largely contributory to the high rate of mortality from sepsis.

Careful study was made of the prenatal care received by the women who died after pregnancies of longer duration than two months and who did not have induced abortions. Almost half of the 1,982 women in this group for whom data on prenatal care were obtained had received no prenatal care at all, and more than one-fourth had received very little care. In only 18 cases did the prenatal care received approximate that recommended in the standards drawn up by the consulting obstetrical committee of the Children's Bureau.[3]

Although the subject of the relative safety of hospital and home deliveries is one on which information is much desired, the maternal mortality rates for home and hospital cases in the 12 States could not be determined, as the total number of births occurring in homes and in hospitals is not known, and for computing rates the figures for both births and deaths are necessary. The study, however, throws considerable light on puerperal deaths in hospitals and homes. For while about 58 per cent of the deaths studied occurred in hospitals, about two-fifths of these hospital deaths followed abortions or other early terminations of pregnancy. Of the women dying in hospitals who had reached at least the seventh month of pregnancy, more than three-fourths had been in hospitals for delivery, but about half of these were reported to have been emergency hospitalizations. Hence only about one-fifth of the maternal deaths occurring in hospitals were reported to have followed planned hospital deliveries at a period of pregnancy later than seven months.

Evidence on other problems secured in this preliminary tabulation can not be discussed here. Analysis of the deaths for the two years will be made in greater detail, and the findings, it is believed, will form a basis for more scientific planning of local maternal-hygiene programs.

CHILD HYGIENE

New Haven rickets study.

Statistical analysis of the material collected in the New Haven rickets study has continued throughout the past year. The complexity of the data, especially those collected for children given repeated examinations, has prolonged the statistical work. Coding is very nearly completed, and tabulation of the material has been started. The growth data have been completed, and comparisons are being made with the standards prepared by the Children's Bureau from material collected during Children's Year. Rates of growth have been computed for 287 babies who had four or more physical examinations during their first six months and also for 160 babies who had four or more examinations at 7 to 12 months of age. These rates of growth are to be used in studying the relation of rickets to growth. It is hoped that analysis of the material will be completed during the coming year.

[3] Standards of Prenatal Care. U. S. Children's Bureau Publication No. 153. Washington, 1925.

Porto Rico rickets study.

Statistical analysis of the data collected in the study of 584 Porto Rican children is complete, and preparation of the report is under way. Growth studies have shown that heights of Porto Rican children from 1 to 33 months of age are below the average heights of the white children of the same ages in continental United States included in the Children's Year series. The weight for age of these same children is also well below the Children's Year standard. When weight for height is considered without age being taken into account, the discrepancy between the two groups is less. The chief difference between the two groups is in height, and it is probable that racial factors are primarily responsible.

Neonatal-mortality study.

Collection of data for a study of causes of neonatal morbidity and mortality has continued with the cooperation of the pediatric, obstetrical, and pathological departments of the Yale School of Medicine. Five hundred and one births were added during the last year to the 100 births included in the preliminary study, making a total of 601 to date. The prenatal, natal, and postnatal medical histories of the mother and infant, as well as social data, are being recorded. These facts are obtained from hospital records, personal interviews with the mothers, and visits to the homes. Examinations of babies to the number of 2,104 have been made, 346 in the preliminary series and 1,758 during the past fiscal year. This exploratory study will be continued during the coming year along the same general lines.

Preparation of new height and weight tables.

The weight, height, and age figures for 83,846 white boys and 81,653 white girls under 6 years of age examined during Children's Year have been reanalyzed to show average weight for height for boys and girls by smaller age intervals and to present the averages for a larger proportion of the children of these ages. The new tables show average weight for height for each month of age during the first year, for each three months during the second and third years, and for each six months during the fourth, fifth, and sixth years. The range of height includes 99 per cent of the children in each age period. The method of reanalysis is that of linear regression, which emphasizes general weight-height relationships and minimizes chance deviations.

Preparation of popular child-hygiene bulletins.

Prenatal Care has been completely revised and to a large extent rewritten; this revision was considered at a meeting of the obstetrical advisory committee of the bureau in December, 1928. New popular bulletins have been prepared to take the place of the present bulletins Infant Care and Child Care (Publications 8 and 30). Much help on these new manuscripts was given by the bureau's pediatric advisory committee [4] at its meeting in May, 1929. The new Infant Care has been sent to press since the close of the last

[4] The members of the pediatric committee are Dr. Howard Childs Carpenter, associate professor of pediatrics, University of Pennsylvania School of Medicine, representing the American Child Health Association; Dr. Julius H. Hess, professor of pediatrics, University of Illinois College of Medicine, representing the section of diseases of children of the American Medical Association; and Dr. Richard M. Smith, assistant professor of child hygiene, Harvard University Medical School, representing the American Pedriatic Society.

fiscal year, and Child Care will be published during the coming year.

Popular folders and dodgers Keeping the Well Baby Well, Why Drink Milk? and Is Your Child's Birth Recorded? have been revised, and two new folders, Out of Babyhood into Childhood and Why Sleep? have been published. Folders on care of the teeth and on posture for preschool children, and leaflets containing child-management lesson material for use in study groups or classes are in preparation.

CHILDREN IN FAMILIES OF MAINTENANCE-OF-WAY EMPLOYEES

From time to time the Children's Bureau has made studies of the welfare of children in families of breadwinners employed in occupations which, because of the migratory or seasonal nature of the work, or the development of single-industry communities, or for other reasons present special problems with reference to living conditions and community relationships. Examples of studies made in the past are studies of child and family welfare in various types of agricultural work, in the coal-mining industry, and in canning industries. During the past year the bureau has been engaged in a study of children of maintenance-of-way employees, of whom more than 250,000 are employed by the railroads of the United States in cities, small towns, and rural areas. The field work on this study is nearing completion. To date, 504 families representing various nationalities and races have been interviewed in cities and rural districts of 12 States. The aim of the inquiry is to gather information, mainly through interviewing the families, concerning the home and community conditions affecting the welfare of the children in these families. Material is being gathered on the economic condition of the family; employment of father and mother; housing; food; clothing; care, schooling, and work of the children; and the relationship of the family to community activities.

CHILD LABOR

Current statistics of employment certificates issued.

The industrial division of the Children's Bureau has continued to obtain reports of employment certificates issued. The occupations and the ages for which these work permits are issued vary from State to State. In general, they are required by the State child labor law for children between 14 and 16 years of age and for occupations other than domestic service and farm work. It is possible from these figures to determine the trend in the legal employment of children for the occupations regulated by law.

Reports were received for the calendar year 1928 from 16 States and the District of Columbia, and from 65 cities in 15 other States. It is estimated, on the basis of the 1920 census, that the number of 14 and 15 year old children receiving certificates represents more than half the 14 and 15 year old children in the United States going to work in occupations for which certificates are usually required under the State child-labor laws.

These reports have been tabulated for all States and for cities with a population of 50,000 or over, in which group of States and cities

ERRATUM

Sentence 2, paragraph 2, under heading "Child Labor" should read: "It is estimated, on the basis of the 1920 census, that the number of 14 and 15 year old children receiving certificates in these States and cities represents more than half the 14 and 15 year old children in the United States going to work in occupations for which certificates are usually required under the State child-labor laws."

102,934 children 14 and 15 years of age and 47,335 children 16 and 17 years of age received regular certificates for the first time in 1928.[5]

Of the 150,269 certificates 126,089 were reported to have been issued to children leaving school to go to work. The remaining 24,180 were issued in States or cities where the child labor law does not specify or the local administration does not provide for a special certificate for vacation and after-school work, and regular certificates are therefore issued for such work;[5a] hence some of these were undoubtedly issued only for employment outside school hours or during vacations.

TABLE 2.—*Number of children 14 and 15 years of age receiving regular employment certificates for the first time in 1927 and 1928 and per cent of increase or decrease, as compared with the previous year, in States and in cities of 50,000 population and over that reported* [a]

[d] Number of 15-year-old children to whom regular certificates were issued; law does not permit the issuance of regular certificates to children under 15. In Hamtramck, Mich., in 1928 regular certificates were issued to 2 children of 14 years, after investigation disclosed necessity for employment.
[b] Children under 16 adjudged incapable of profiting substantially by further instruction.

For the group of States and cities reporting to the Children's Bureau over a period of three years the total number of first regular employment certificates issued to 14 and 15 year old children was 6 per cent less in 1928 than in 1927, and in 1927 was 8 per cent less than in 1926. In 1928 as compared with 1927, the reports for 11 States and 29 cities in other States show decreases varying from less than 1 per cent to 93 per cent in the numbers of such certificates issued. Increases of 3 to 64 per cent for 1928 over 1927 were reported for the District of Columbia, 4 States (Kansas, New Hampshire, Vermont, and Washington), and 12 cities in States not reporting (Pasadena, Denver, Springfield (Ill.), Lowell, Lynn, Detroit, Hamtramck, Kalamazoo, Niagara Falls, Toledo, Providence, and Salt Lake City).

The opposite movement was shown in 1928 in the employment of 16 and 17 year old minors. States and cities for which the information is available reported an increase of 6 per cent in 1928 as compared with 1927 in this upper-age group in contrast to a 12 per cent decrease in 1927 as compared with 1926. Exceptionally large increases for 1928 over 1927 in the number of boys and girls who went to work between 16 and 18 were reported for Hamtramck, Mich. (118 per cent), and Niagara Falls, N. Y. (95 per cent). In the State of Washington, and in Grand Rapids and Salt Lake City the increases were between 29 and 35 per cent. On the other hand, decreases were reported by Alabama and Oregon, and by San Francisco, New Orleans, Saginaw, Rochester (N. Y.), Yonkers, Springfield (Ohio), and Toledo.

The factors involved in either an upward or a downward trend are too various for general analysis. It reflects the decrease or increase of opportunities for employment. In some places a change in the law or in the administration of the law explains an increase or a decrease. For example, in Maine, where the decrease in the number of children under 16 to whom work permits were granted was 52 per cent, the raising of the educational requirement to completion of the eighth grade was effective over a whole calendar year for the first time in 1928; in Saginaw, Mich., where the decrease was 93 per cent, the largest reported by any city or State, the explanation seems to be the adoption of a policy of issuing certificates to children under 16 only if their earnings are in fact necessary to the support of the family; in Niagara Falls, which reported the largest increase of any city or State, a more rigid enforcement of the certificate law seems to be the explanation of the apparent increase in the number of working children. Sacramento reported that a junior high school curriculum especially adapted to meet the needs of boys and girls who grow impatient with school at this age was the explanation of the fact that there had been no increase in the number of children leaving school for work, in spite of a large increase in the school population of the city. Offices in New Orleans, Grand Rapids, Saginaw, Minneapolis, Buffalo, New York City, and Philadelphia reported a tendency on the part of employers to give preference to minors 16 years of age and over.

The age at which children under 16 received certificates was reported by the District of Columbia, 15 States, and 48 cities in 16 other States. In these places 36 per cent of the children were 14 years of age and 64 per cent were 15 years of age. The proportion who were 14 was slightly smaller in 1928 than in 1927—36 per cent compared with 38 per cent.

Of the children 14 and 15 years of age receiving certificates for whom sex was reported, 56 per cent were boys and 44 per cent girls. In the 16 and 17 year old group 55 per cent were boys and 45 per cent girls.

Separate reports of certificates issued to white and colored children 14 and 15 years of age were made for 1928 by the District of Columbia, 9 States, and 38 cities in other States. In this group the number of first regular certificates issued to colored children was less than 2 per cent of all such certificates issued, though 12 per cent of the 14 and 15 year old children in the United States are colored.[6] In the 1 State and 17 cities in 8 other States which reported this information for minors 16 and 17 years of age in 1928 the proportions were about the same as for those 14 and 15. This is not a measure of the proportion of white and colored children going to work, since colored children are frequently employed in domestic and personal service or in agricultural work, for which employment certificates are usually not required.

Of the 14 and 15 year old children receiving employment certificates in 1928 for whom information as to school grade completed was furnished more than half (59 per cent) had completed the

[6] Fourteenth Census of the United States, 1920, vol. 2, Population, p. 162. Washington, 1922.

eighth or a higher grade in school, and 24 per cent had completed only the sixth or a lower grade.

In a number of States the law requires that children between 14 and 16 years of age must complete the eighth grade in school before they can receive employment certificates. In the reporting States having this provision in their State laws, the percentages of the children receiving certificates who had completed the eighth grade were as follows:

	1927 Per cent	1928 Per cent
Indiana	[7] 100	100
Fort Wayne	[8]	[8]
Gary	[8]	[8]
Hammond	[9]	[8]
Indianapolis	100	100
South Bend	100	100
Kansas	92	88
Kansas City	86	86
Kansas—Continued.		
Topeka	[8]	[8]
Wichita	[8]	[8]
Minnesota	100	100
Minneapolis	100	100
St. Paul	100	100
Oregon	[9]	100
Vermont	[8]	34

In a group of States the State law, although fixing the eighth-grade educational requirement, provides for certain exceptions. In these States the percentages of certificated children who had completed the eighth grade were as follows:

	1927 Per cent	1928 Per cent
Delaware: Wilmington	77	67
District of Columbia	97	94
Maine	70	100
Portland	[8]	[8]
Nebraska: Lincoln	[8]	[8]
Rhode Island: Providence	[9]	44
Wisconsin	82	85
Milwaukee	83	87

In two States completion of the eighth grade is required for children 14 years of age but not for children 15. The percentages of 14 and 15 year old children in these States who had completed the eighth grade are given below:

	1927 Per cent	1928 Per cent
California:		
Los Angeles	69	66
Oakland	95	92
Sacramento	[8]	[8]
San Francisco	99	83
New York:		
Buffalo	62	60
New York	67	69
Niagara Falls	59	57
Rochester	62	61
Yonkers	64	65

For the States not requiring the completion of the eighth grade there was great variation in the number of children who had completed that grade before they went to work. It will be noted in the list given below that 14 per cent in Knoxville, Tenn., 22 per cent in Mobile, Ala., and 23 per cent in Newark, N. J., as compared with 70 per cent in Chicago, 91 per cent in Bridgeport, Conn., and 93 per cent in Manchester, N. H., had completed the eighth grade, although this was not required by the State employment certificate law.

Most States make no educational requirement for minors 16 and 17 years of age going to work; but in Ohio completion of the seventh grade is required with certain exceptions (usually economic need or inability to make further progress in school), and in Utah the law requires (with the same exceptions as are made in the case of minors under 16) full-time school attendance unless they are employed full time.

The percentages of these 16 and 17 year old minors who had completed the eighth grade in 1928 before going to work in the States and cities reporting on this point are given below:

	Per cent
Total	71
Alabama	30
Birmingham	65

The work which the children undertook as their first job can be classified only in certain general occupational groups. In the District of Columbia, 11 States, and 40 cities in 17 other States report-

[10] Per cent not shown because number of children is less than 50.
[11] A law approved June 17, 1929, raises the educational requirement for issuance of regular employment certificates to completion of the eighth grade.
[12] Not reported for 1927.

ing on occupations, 41 per cent of the children under 16 entered manufacturing and mechanical work, 24 per cent mercantile employment, and 13 per cent messenger, errand, and delivery work; 22 per cent were scattered in small groups in offices, domestic and personal service, and miscellaneous occupations. As would be expected, the distribution in 1928 was practically the same as in the preceding year. The largest proportion of both 14 and 15 year old children and of both boys and girls entered manufacturing and mechanical occupations; the next largest proportion of boys were first employed in public messenger and delivery service, and the next largest proportion of girls entered domestic service. Proportions in the different occupational groups varied with the locality.

Among minors of 16 and 17, also whether girls or boys, manufacturing and mechanical work predominated. The group of mercantile occupations was second largest in each of these age groups for boys and for 17-year-old girls, but more 16-year-old girls, like younger girls, had gone into domestic service than into trade.

Certificates limited to work out of school hours or to the regular school vacations permit children to work during the summer and other school vacations and during out-of-school hours without releasing them from school. In some places regular certificates are issued for such work and no separate record made. A comparison of the numbers of vacation and out-of-school certificates issued in 1927 and 1928 shows a somewhat larger number of States and cities reporting increases than reporting decreases.

The nature of the evidence of age accepted is always one of the most important factors in enforcing the standards of a child labor law. Birth certificates or baptismal records, generally believed to be the best proof of age, were filed for 84 per cent of all regular certificates issued to 14 and 15 year old children for which reports were received. Wide variations, however, were found between individual States and cities in the kinds of evidence accepted. For instance, in the California cities school records predominated, and in the State of Washington, parents' affidavits were reported as accepted in all cases, while in a number of States and cities more than 90 per cent of the certificates had been issued on birth or baptismal certificates.

Continuation-school children in Newark and Paterson, N. J.

The report of a study of the employment of continuation-school children in Newark and Paterson was completed during the year. These two industrial cities show many local differences as well as similarities. In both the tendency for children who were going to work to leave school as soon as they reached the legal age was marked. A larger number of the children had left within six months after reaching the age of 14, the minimum working age under the child labor law, than at any other six-month period up to the age of 16. In each city about one-fifth of the children had only the minimum schooling required by law, at that time completion of the fifth grade. A much lower percentage of the Newark and Paterson children than of children taking out employment certificates in many other child-employing cities had completed the eighth grade.

The largest number in both cities had begun their working lives as semiskilled factory operatives—48 per cent of the boys and 82

per cent of the girls in Paterson and 36 per cent of the boys and 70 per cent of the girls in Newark. The remaining boys went chiefly into messenger, errand, and office-boy work; selling positions; delivery and clerical work. Work for girls, other than in factories, consisted chiefly of store positions, domestic service, and clerical work. The median weekly wage in initial positions in either city was between $10 and $11 for boys and between $9 and $10 for girls.

The evidence obtained in this study does not show that on the whole children who leave school for work at an early age are unemployed a large part of the time, although many had had a considerable amount of unemployment. In Newark 56 per cent of the girls and 61 per cent of the boys, and in Paterson 62 per cent of the girls and 78 per cent of the boys, had been out of work not at all or less than 5 per cent of their working lives. On the other hand, in Newark 21 per cent of the boys and 26 per cent of the girls had been unemployed at least one-fifth of the time since going to work.

Children who had been 15 years of age when they first went to work seemed to have a somewhat wider choice of employment on the whole and slightly better wages than those who went to work at an earlier age. Those from the lower school grades and those who had been retarded in regular school were more likely to take factory employment, and those from the higher grades, office and sales work. Where the numbers of children were sufficiently large, as in Newark, for differences between different groups to have significance, completion of the eighth or a higher grade seemed to result in somewhat better wages, though it appeared to have no clear relation to unemployment. Children who had been retarded in school received about the same wages as those who had been in normal or advanced grades, no doubt because a larger proportion went into factory work, which was on the whole somewhat better paid than the other kinds of employment in which the children engaged, but possibly also because they were a little older on going to work than those who had not been retarded.

Employment histories of minors attending continuation school in Milwaukee, Wis.

A preliminary analysis has been made of information obtained in a study of the employment histories of 9,161 minors enrolled in the Milwaukee continuation school in January, 1925, who were or had been gainfully employed since leaving full-time school. More than four-fifths of the number were 16 to 18 years of age, inclusive, at the time of the inquiry; the remainder, 1,564 (17 per cent) were under 16.

Under the provisions of the Wisconsin child labor law, employed minors are required to attend continuation school until they are 18 years of age. As the majority of the Milwaukee children had not left school for work until they were at least 15 years of age, only a relatively small number had attended continuation school for as long as three years and few as long as four years.

Satisfactory information regarding the number of positions held since leaving school and the amount of unemployment was obtained for a group of boys and girls believed to be representative of the total number. Twenty-six per cent of this group had had but one position, but the remainder had changed from one to thirteen times. The great majority of those who had a work history of as long as

one year had had but little unemployment. Fifty-five per cent of this group who were under 16 years and 63 per cent of the group who were 16 years or over had been out of work less than 10 per cent of the time. A considerable number, however, reported a large amount of unemployment; 16 per cent of those under 16 and 9 per cent of those 16 years and older had been out of work at least half the time. Boys and girls from the higher school grades, especially boys, appeared to have had somewhat less unemployment than those from lower grades and those without special training.

Nearly half (45 per cent) of the boys and more than three-fifths (62 per cent) of the girls were employed at the time of the inquiry as semiskilled operatives in factories. A considerable number of boys were in occupations classified as clerical, including errand and messenger work, or were special-delivery or telegraph messengers; smaller numbers were employed in stores as sales or stock boys or were delivery boys; a number (7 per cent) were apprentices. Most of the girls who were not in factories were clerical workers or telephone operators or were working in stores; a small number were in domestic service. Boys and girls who were 16 years or older were employed in a greater variety of work than the younger children, both in their first positions on leaving school and in the positions in which they were employed at the time of the study. Telephone operating, in which a number of the older girls were employed, is not open to girls under 16, and apprenticeship, to which many of the older boys were indentured under the Wisconsin apprenticeship law, is not permitted by the law to boys under 16.

The median wage for boys under 16 in their last position was $10 a week and for boys 16 years and older, $13 a week. Only 7 per cent of the boys under 16 as compared with 31 per cent of the older boys earned $15 or more a week. The median wage of girls under 16 was $9 a week and of older girls, $12. No doubt one reason for the greater earning capacity of the older boys and girls was that on the whole they had been employed a longer time than those who were younger. Both boys and girls who had had high-school or commercial training were found to be earning somewhat better wages than those from the elementary-school grades. Probably this difference would have been more marked had it not been for the relatively high wages paid for some kinds of factory work as compared with clerical work in which minors with more education were frequently employed.

Injured minors under workmen's compensation laws.

The principal new undertaking of the industrial division of the bureau during the past year has been a study of workmen's compensation laws as they affect injured minors. The purpose of this study is to ascertain what provisions are made in the various States to compensate minors injured through industrial accidents and how these provisions are administered. The study will include an analysis of the reported decisions of State courts and of compensation commissions relating to provisions of the workmen's compensation laws that affect minors. Special inquiry is being made regarding the operation of laws that provide extra compensation for minors injured while illegally employed and of laws that exclude such minors from compensation, and regarding the methods of recording

and investigating injuries to minors used by the State agencies to ascertain the legality of their employment and their exposure to preventable hazards.

Vocational pamphlets.

A pamphlet on vocational opportunities in the printing and allied trades, based on interviews with employers and workers in 7 cities, has been prepared primarily for the use of teachers and school counselors teaching classes on occupations or giving educational and vocational guidance to individuals.

A similar pamphlet on the women's clothing industry is under way.

Series of nontechnical child-labor bulletins.

During the past year two bulletins have been published in the nontechnical series, which, it is planned, will present briefly the results of the bureau's inquiries as to various aspects of the child-labor problem. These bulletins are entitled, "Children in Agriculture" and "Child Workers on City Streets."

RECREATION

Statistical analysis of the information obtained in the study of recreation of children living on farms and villages in West Virginia has been in progress during the year. The purpose of this study was to ascertain the actual leisure-time activities of rural children and the extent of their social group contacts which could be used as a basis for outlining a recreational program for rural communities. In order to have an accurate sample of rural conditions all the children between the ages of 10 and 18 years of age in rural sections of 12 school districts, who were attending school, were interviewed. Although the analysis of this material is not complete the study has demonstrated two fundamental needs of rural communities: (1) A recreation program that will coordinate the activities of all agencies contributing to the social life of rural children; (2) some method of making available to rural groups for consultation or demonstration the services of trained recreation leaders.

During the past year the bureau's specialist in recreation has devoted much time to the problem of recreation among rural children in cooperation with the extension divisions of the Federal and State Departments of Agriculture. Though the 4–H clubs for the farm boys and girls were organized as a method of teaching scientific agriculture and homemaking, the United States Department of Agriculture is promoting a program for the rounded development of the members, and in recent years the Children's Bureau has been requested to cooperate in developing the recreational program for these clubs.

During 1928, at the request of the extension service of the State agricultural college in nine States, courses in recreational leadership for members of 4–H clubs for boys and girls and of farm women's clubs, and for club leaders and other interested adults were given by the bureau. Requests for similar cooperation were received from 10 additional States, which could not be accepted.

The assistance usually given in a State has been of two types: Instruction to 4–H club members in camps or short courses at the

State colleges, and more advanced courses at institutes for State agents or recreation leaders.

During the summer vacation months representative boys and girls are selected from club groups throughout the State to go to the State college or to special 4–H club camps for a week of training in club work. The groups particularly interested in recreation are given daily work in games and program planning by the bureau's representative. Members of a class of this sort are responsible for the evening-game periods for the whole camp. Some instruction in song leadership, music appreciation, story-telling, folk dancing, and informal dramatics is also presented during the week, and material prepared in class is used at the camp fire or during assembly periods. Similar work is undertaken at State camps for adult club members. During the year ended June 30, 1929, 3,550 boys and girls and adults received instruction from the specialist in recreation of the Children's Bureau in these camps and short courses.

Attendance at regional institutes held in the fall and winter is limited in some States to employees of the extension service; in others church and school workers, volunteer club leaders, and older boys and girls are included. These institutes, usually held in a town centrally located for several counties, last for two days. In the course given by the Children's Bureau, programs to be used by 4–H clubs are studied, games and "stunts" are tried out, and the group members are given an opportunity to lead games and songs. This training course is the only opportunity that many club leaders have to obtain help in recreational leadership, and letters received by the Children's Bureau following these institutes indicate that they have been of great help in promoting recreation for the whole community as well as for the 4–H clubs. During the past year instruction was given in institutes in five States and at one interstate conference to 1,493 persons.

A special program to improve the posture of rural children was undertaken during April in New Hampshire. This work was started in the clubs for farm women. The Children's Bureau posture film was shown with a brief explanation, a demonstration of simple corrective work was given, and games that would develop good posture were taught. The leaders were then given an opportunity to judge and correct the posture of a small group of boys and girls. About 1,700 women attended these meetings.

The need of promoting group play among rural children has been repeatedly pointed out by students of the subject. The time of the bureau's representatives is promised more than a year in advance, and last year it was necessary to refuse more requests for cooperation with the Extension Service than it was possible to accept.

DELINQUENCY AND CHILD WELFARE

The number of courts cooperating with the Children's Bureau in its plan for the uniform recording of juvenile-court statistics is steadily increasing. On July 1, 1929, 150 courts had asked for the statistical cards, and at least 100 may be expected to report for the entire year 1929; 65 courts reported throughout the calendar year 1928 and 43 throughout the year 1927. It is hoped that through simplification of the plan for use in communities of less than 100,000

now being worked out in consultation with the State departments to which these courts are required to report by law, data for the States as a whole can be obtained. Under this plan courts serving cities or counties of 100,000 or more population will continue reporting directly to the bureau on cards supplied for that purpose. Comparable statistics will be available for the whole reporting area with greater detail given for the larger cities.

During the calendar year 1928, 38,882 delinquency cases, 16,289 dependency or neglect cases, and 10,429 cases of children who were discharged from probation or supervision were reported to the Children's Bureau by the juvenile courts from which figures were received for the entire year. Though a few of the delinquent children had been before the courts as many as five or more times, 80 per cent were there for the first time in 1928; for 11 per cent this was a second appearance.

What may be called the juvenile-delinquency rate in a city or a county has been determined by calculating the ratio of the delinquent children brought before the court to 1,000 population of juvenile-court age in all the reporting areas having 100,000 or more population. These ratios, given in the table which follows, reveal well-known facts such as, for example, that delinquency is much more common among boys everywhere than among girls, as well as unexpected differences between cities and counties which could be explained only by a study of local conditions.

TABLE 3.—*Ratio of delinquent boys and girls to 1,000 estimated population of the same sex of juvenile court jurisdiction age dealt with by courts serving cities or counties having 100,000 or more estimated total population in 1928, and ratio for white and colored boys and girls dealt with by courts serving communities of the same size having at least 10,000 or 10 per cent colored population in 1920; courts reporting statistics to the Children's Bureau in 1927 and 1928*

[1] Not reported.
[3] Figures incomplete.
[4] Figures for white and colored children not separately reported.
[5] Includes Salt Lake, Summit, and Tooele Counties.

Negro children are more likely than white children to come to the attention of juvenile courts because of delinquency. Only 5 per cent of the population served by courts reporting in 1928 were negroes, whereas 15 per cent of the boys and 21 per cent of the girls dealt with in delinquency cases were negroes.

Foreign-born children constitute a very small percentage of delinquent children who come before the courts. In 1928 only 2 per cent of the delinquent white boys and 3 per cent of the delinquent white girls dealt with by the 62 courts were reported as of foreign birth,

although in 1920, 27 per cent of the white males and 24 per cent of the white females residing within the areas served by these courts were reported as foreign born. The very small representation of foreign born among delinquent white children is doubtless due partly to the fact that a smaller proportion of the foreign-born white than of the native white population is of juvenile-court age.

One or both parents of 56 per cent of the native white delinquent boys and 45 per cent of the native white delinquent girls dealt with by courts reporting in 1928 were foreign born. In the total native white population residing in these communities 47 per cent of the males and 48 per cent of the females were reported in 1920 as of foreign and mixed parentage. On the basis of these figures, the percentage of delinquent boys of foreign or mixed parentage appears to be somewhat higher than would have been expected if delinquency had been equally prevalent in proportion to population among boys of native and boys of foreign or mixed parentage, whereas the percentage of girls would probably be about the same. Absence of information as to age distribution according to nativity of parents in the communities included makes it difficult to make exact comparisons. Study of figures for individual courts shows variations so great that it is difficult to draw valid general conclusions. With some exceptions, communities with a large foreign-born population appear to have an even larger percentage of delinquent children of foreign parentage, whereas in many communities with a small foreign-born population the reverse appears to be true.

The following table showing disposition made of delinquency cases indicates the importance of probation as a method of treatment, as it was used in one-third of the cases. More than one-fourth of the cases were unofficial, and the inclusion of this group affects the percentage dismissed or continued indefinitely without treatment. Nevertheless these figures raise the question whether a considerable number of conduct problems that might be dealt with by other social agencies are not brought to the attention of the court unnecessarily.

TABLE 4.—*Dispositions in 1927 and 1928 in boys' and girls' delinquency cases disposed of by juvenile courts reporting statistics to the Children's Bureau*

[1] One of the 43 courts reported too late for the figures to be used in the 1927 study.
[2] Three of the 65 courts did not report delinquency cases in 1928.

Pending hearing or disposition of their cases a large number of children—in 1,195 of the boys' cases and in 110 of the girls' cases—were reported to have been detained in jail or police station last year. While most of those so detained were in the 16 to 18 year age group, in 132 cases the children were under 14.

The offenses committed by the children brought before the 62 courts reporting delinquency cases in 1928 were substantially the same as 42 courts reported for 1927, as the following table shows:

TABLE 5.—*Charges in 1927 and 1928 in boys' and girls' delinquency cases disposed of by juvenile courts reporting statistics to the Children's Bureau*

Charge	1927 (42 [1] courts reporting)				1928 (62 [2] courts reporting)

[1] One of the 43 courts reported too late for the figures to be used in the 1927 study.
[2] Three of the 65 courts did not report delinquency cases in 1928.
[3] Less than 1 per cent.

The full statistical report for 1928, which is to be published shortly, will contain general tables giving the data by the reporting area—city, county, or State as the case may be—for delinquent children as well as for the dependent children who were brought before the courts.

Juvenile delinquency in Maine.

During the year field work was completed on a survey of juvenile delinquency in Maine. A preliminary report was prepared and presented in Augusta at a conference of interested persons called by the State department of public welfare. The final report has been completed and will be published shortly.

Maine has no special courts for dealing with children, so that information as to the extent of juvenile delinquency was obtained where possible from courts and private agencies responsible for the care of children. These courts and agencies reported on forms prepared by the bureau facts with reference to 359 cases of delin-

quent children who had been under care during a 6-month period in 1928. These 359 cases gave some indication of the character of the offenses committed by children and of the disposition made of their cases, but investigation showed they could not be looked upon as a measure of the extent of juvenile delinquency in Maine.

The procedure in different courts and the relation of the courts to other agencies caring for delinquent children were studied in three counties. The general information obtained through interviews and attendance at court sessions was supplemented by information as to the actual procedure used and the action taken in a selected group of cases.

The following are some of the greatest weaknesses in the present methods of caring for delinquent children in Maine: No one agency is responsible for making a thorough study of personality problems and social environment of a delinquent child, for deciding whether the case needs formal action by the court, and for presenting information about the child to the court as a basis for disposition of the case. Jurisdiction over delinquency cases is vested in 154 trial justices, 43 municipal and police courts, and the superior and supreme judicial courts; although provision has been made for special procedure in dealing with delinquent children under 16 years of age, some of the courts disregard these provisions and use the same procedure as for adults accused of crimes or misdemeanors. In a few courts hearings were public, and reports of cases were published in the newspapers. None of them had the staff for any investigation of the child's social, physical, and mental history. More than one-fifth of the 214 cases which had been before municipal and justices' courts were bound over to the higher courts. This meant not only two court hearings but in some cases in which bond was not furnished, jail detention awaiting the session of the higher courts for children under 16 years of age. Eleven of the 44 children held for the superior courts were known to have been detained in jail for periods varying from one day to more than two months. In contrast to these practices a few of the courts in Maine visited in the course of the investigation were using the same procedure in children's cases as is generally found in good juvenile courts.

The recommendations made in the report include the following: Special court organization for hearing children's cases where the procedure used will be chancery or equity and not criminal; the appointment of special probation officers serving the courts designated as juvenile courts; prohibition of jail detention for children; development of itinerant child-study clinics to serve the courts; more adequate parole supervision for children released from the State schools; raising of the upper age limit for admission to the State training schools; development of a program for the treatment of conduct problems by the schools.

State training schools for boys.

Plans are in progress for a study of the care and training given to boys committed to State training schools. This study will have two aspects: An investigation of the institution itself, including its equipment and the character of the training given, and a study of the effect of the training as shown by case histories of boys who have been paroled or discharged from the institution. In order to

reach conclusions as to the value of the institution in a program for the care of delinquent boys, what are believed to be the best schools in the various sections of the country will be studied.

DEPENDENT CHILDREN

Conference of State departments of public welfare.

A conference limited to representatives of State departments of public welfare was held at the Children's Bureau February 13, 14, and 15, 1929. This conference was called by Secretary Davis in response to numerous requests that have come to the Children's Bureau from a number of States. Among the representatives of the 32 States who attended were directors of State departments, members of State boards, and staff members engaged in some particular aspect of State work for dependent children. The entire time during the five sessions was devoted to discussion of dependency and child protection, the special topic for each session being introduced in an informal paper by one of the State representatives.

The subjects discussed were the scope of child-welfare activities of a State department, county welfare problems, the supervisory work of State departments, provisions for the care of dependent children by the State department, and minimum statistics that should be obtained by State departments from child-caring agencies and institutions.

A resolution was adopted asking that similar conferences be called from time to time. At the request of the conference a committee is to be appointed to outline standards in State work for dependent children and to consider uniform dependency statistics.

In 35 States the State department, board, or commission concerned with child welfare has authority to supervise all or part of the private child-caring and child-placing institutions and agencies and in most cases to require annual or monthly reports from these agencies. Although the value of a stock taking as to the amount and character of child dependency in the United States is realized generally, no agreement has been reached by these departments as to the character of the information to be gathered or as to the most satisfactory methods of collecting it. In order that the bureau may be able to cooperate with the committee to the greatest advantage preliminary work should be started at once on the analysis of existing statistics, the preparation of record forms, and the study of administrative problems involved in the collection of these statistics in different States.

Public aid to mothers with dependent children.

In furtherance of the plan to provide for local administrators of mothers' aid laws an opportunity for consultation in their own States with a member of the bureau staff, brief courses and round tables on mothers' aid administration have been conducted in six States, usually in connection with the State conferences of social work. In Colorado, Ohio, and Wisconsin 3-day institutes were held by the bureau's specialist in this field. Attendance at these institutes was limited to social workers, principally to mothers' aid administrators, regularly enrolled for the course. In Iowa, Pennsylvania, and

Wyoming the audiences were more general, including executives, volunteer members of board of administration, public officials, and persons interested but not actively engaged in the work. These contacts have given evidence of the need and the desire for help, especially in rural counties, in the problems which develop in administering legislation of this type.

Local communities are interested in studying the number of families needing mothers' aid and the number of families receiving such assistance in relation to the total number of mothers left with the responsibility for the support of dependent children. As a beginning in furnishing such information the Children's Bureau has tabulated, through the courtesy of the Bureau of the Census, the number of widows with children under 16 years of age, and the numbers of children in these families under 14 and 14 and 15 years of age, as reported in 1920 in 8 cities and 6 counties. These localities ranged in size from approximately 126,000 to 1,800,000 and represented a total population of almost 7,000,000. The figures will be compared with the number of widows receiving public aid for the care of children under the age of 16 years.

STATE AND COUNTY CHILD-WELFARE AGENCIES

The Minnesota Children's Bureau.

During the past year field work has been completed on a study of the activities and functions of the children's bureau of the Minnesota State Board of Control made at the request of the State board. This investigation has included two general aspects: A study of the records and administrative procedure of the central office and investigation of the actual work being done for children throughout the State as represented by selected counties. Minnesota has been the pioneer in developing a coordinated State and county program for child care, and the results of its experience will be of great value to other States now undertaking similar programs.

Since the time of organization of the first county board in Minnesota in 1919 such boards have been established in all but three of the counties of the State. The United States Children's Bureau has made an intensive study in six counties of the development, activities, and quality of work done by these boards and the extent to which they were filling the place of a county welfare agency as well as serving as an agent of the State. The counties selected included two of the larger counties, in which the work of the board was done by a trained staff, and four smaller counties, two with boards having trained executive secretaries, one with a part-time untrained secretary, and one in which all the work of the board was done by unpaid board members.

Special attention was also given in this study to the achievement and methods used by the State in the protection and care given to unmarried mothers. Minnesota is the only State that has developed a comprehensive program of supervision of children born out of wedlock and protective work for their mothers.

State departments or boards.

A general study in 10 representative States of the work of the State departments or boards concerned with the care of children

who are socially, physically, and mentally handicapped has continued during the year. The final schedules have been prepared, a preliminary study has been made of the legal provisions and administrative development in most of the States selected for study, and the field work in 3 States has been completed.

COOPERATION WITH CHILD-WELFARE MOVEMENTS IN OTHER COUNTRIES

The bureau has continued to maintain contacts with the International American Institute for the Protection of Childhood, a Pan American organization with headquarters in Montevideo, which has been established as a clearing house of information and research. The assistant to the Chief of the Children's Bureau has been designated as the United States member of the council of the institute.

Certain material on various subjects, as requested, was furnished the Commission for the Protection and Welfare of Children and Young People of the League of Nations, on which the Chief of the Children's Bureau serves in a consultative capacity as the American member.

The Children's Bureau was represented at the International Social Welfare Fortnight held in Paris, July 2–13, 1928. Four congresses comprised the fortnight: The housing and town-planning congress, the congress on public and private relief, the child-welfare congress, and the conference of social work. The chief of the bureau acted as rapporteur for the section on dependent children of the child-welfare congress, which involved the preparation of a summary of the developing trend of social work being done for dependent children in the countries for which reports were available. The conference of social work was the first international congress of its kind ever held. In all the conferences emphasis was laid on the following points: (1) The development of activities tending to prevent social distress and maladjustment; (2) recognition of the family as the primary social agency, to be stabilized, strengthened, and conserved in every possible way, for example, through better housing, social insurance, social case work, protection of maternity and infancy, and care and protection of dependent and delinquent children; (3) study of the individual and adaptation of social programs to individual needs; and (4) coordination and correlation of all movements looking toward human betterment.

STATE CHILD-WELFARE COMMISSIONS

Official commissions for the study of child-welfare legislation and administration have been active during the year in only two States—California and South Dakota. New child-welfare commissions were established by act of the legislature in Illinois and Massachusetts. A child-welfare committee was appointed by the Governor of Wyoming, without legislative action. In Maryland the legislature created a social-welfare survey commission of seven members to investigate and make recommendations to the governor regarding the care of the disadvantaged citizens of the State, the functioning of State welfare departments in other States, the social problems and

needs of Maryland citizens, and related subjects. The Florida Legislature requested the State board of public welfare to make a study of juvenile delinquency and dependency in the State, including State and county institutions, juvenile courts, and probation, and to report recommendations to the next legislature. A bill to create a children's code commission was introduced in the Washington Legislature but was not passed.

The California Commission for the Study of Problem Children, appointed in February, 1928, in accordance with an act of 1927, has published a report dealing with some of the outstanding needs of the State in regard to the prevention of delinquency, which includes a general statement of the causes of delinquency and its prevention and specific items for further investigation and consideration. The law creating the commission was amended and the commission continued.

The South Dakota Child Welfare Commission continued the activities in which it has been engaged for some years, giving special attention to the work of county child-welfare boards. The third annual conference of these boards with the State commission was held in connection with the seventh annual conference of social work in Huron, in October, 1928.

At the annual meeting of the Illinois Conference of Public Welfare held in Quincy in September, 1928, a committee appointed at a previous meeting to consider the subject of a child-welfare commission made a comprehensive report covering some of the outstanding needs of the State. The 1929 session of the legislature authorized the governor to appoint a committee of specially qualified men and women, representing the legislature, the State department of public welfare, and the public and private child-welfare organizations throughout the State, to conduct such studies of the legislation relating to child welfare and the operation thereof, as may be necessary to revise and codify such legislation and determine its operation. No appropriation was made.

The Massachusetts commission was created by the legislature in accordance with a recommendation of the governor in his annual message. This commission, consisting of three ex officio and two appointed members, is to study and revise the laws relating to dependent, neglected, and delinquent children and other children requiring special care. Ex officio members are the commissioner of public welfare, the commissioner of mental diseases, and the deputy commissioner of probation.

CHILD-WELFARE LEGISLATION, 1929

During 1929 regular legislative sessions were held in 43 States, and special sessions were also held in Florida and Texas following adjournment of the regular sessions. The only States not having regular sessions during the year are Alabama, Kentucky, Louisiana, Mississippi, and Virginia. Legislative material has been received by the Children's Bureau from nearly all the States, and from Porto Rico and Hawaii.

Child hygiene and public health.

Laws relating to county and city health measures were enacted in a number of States. Iowa authorized county boards of supervisors to

adopt the county health unit plan and to appoint county boards of health under which all public-health activities in the county may be coordinated. Wisconsin also provided for county departments of health and the employment of county health officers and necessary assistants. These departments in Wisconsin are to have all the powers now vested in local boards of health and local health officers throughout the county except in towns, villages, or cities having full-time health departments, which may, however, elect to come under the jurisdiction of the county health department. Kansas authorized boards of county commissioners to levy taxes for county health funds, certain counties being excepted. Michigan authorized the State health commission to refund to county or health districts up to 25 per cent of the cost of maintenance of county health departments but not more than $3,000 each per annum.

California provided for the employment of dentists and dental hygienists by towns and cities and counties and authorized any city, county, or city and county or group of counties to establish and maintain tuberculosis preventoriums and to receive State aid for the support of indigent persons cared for therein. Massachusetts passed a law permitting two or more towns jointly to employ a health officer. In Nevada any county or group of counties is authorized to levy a tax for the purpose of establishing and maintaining public hospitals and training schools for nurses. New Jersey provided that counties having no county hospital may appropriate money for the maintenance of private or charitable hospitals in the county and authorized counties and municipalities or school districts jointly to provide for a public-health service furnishing public-health nurses, medical inspection, and public clinics.

Kansas prescribed precautions required to prevent blindness in newborn babies. Nevada passed a birth and death registration law. Pennsylvania provided for the licensing of midwives, and Connecticut weakened the law on this subject, repealing the more comprehensive law of 1923.

Measures relating to school hygiene and health of pupils were enacted in some States. Illinois and Ohio authorized the employment of school dentists, and North Carolina provided for the licensing of mouth hygienists with prescribed qualifications to teach and practice mouth hygiene in public institutions and public schools. Pennsylvania amended the law relating to the employment of school nurses, authorizing two or more districts jointly to employ a school nurse. Texas enacted a law making physical-education courses part of the training in public elementary and secondary schools by September 1, 1930. Colorado and New Jersey authorized boards of education to install, and operate without profit, cafeterias or lunch rooms for school children.

Among the health measures which were introduced but not enacted into law were those in Florida providing for county boards of health throughout the State; a New York bill to provide for licensing of unincorporated maternity homes and hospitals; a Pennsylvania bill for licensing of private nursing homes; a comprehensive bill introduced in Colorado, which would have authorized counties to employ teachers of public-health education and public-health nurses, prescribing the duties of these positions; Indiana and Massachusetts

bills providing for school dentists or dental hygienists; and a Michigan bill to provide for county poor physicians.

Child labor and compulsory school attendance.

Laws making significant advances in the educational standards which a child must meet before he can obtain an employment certificate were enacted in three States—Illinois, Maryland, and Missouri. In Illinois the standard was raised from completion of the sixth to completion of the eighth grade, and in Missouri from no educational requirement at all to completion of the sixth grade. In Maryland heretofore completion of the fifth grade has been required in the city of Baltimore, and completion of the elementary-school course (seventh grade) outside Baltimore, while the new law requires throughout the State completion of the "course prescribed for elementary schools" in the city or county where the child lives. The requirement in the counties is thus left unchanged, but the standard for Baltimore is raised to completion of the sixth grade, the last grade of the elementary-school course in that city. Illinois, in addition, made provision for the issuance of certificates for work during vacation and outside school hours to children unable to fulfill the eighth-grade requirement (provided the total hours of work and school do not exceed eight a day), strengthened the administrative provisions of the employment certificate law, and removed the eighth-grade exemption from the compulsory school attendance law. The Missouri law was also strengthened by the elimination of the clause allowing children between 12 and 16 years of age attending school to work two hours after 7 p. m., by an advance in the standard for evidence of age to be required for employment certificates, and by improvement of the administrative provisions. This law does not apply to children in street trades and in agricultural and domestic pursuits, nor to children working for their parents.

New legislation in California requires that beginning July, 1930, children between 14 and 18 years of age who have left school for work must attend continuation school three hours a day while temporarily unemployed; provides for vocational guidance and placement for continuation-school children; strengthens the administrative provisions of the certificate law; and makes it clear that the exemption of agricultural and domestic work outside school hours from the child labor law is not to be construed to permit the employment of children under school age (i. e., under 8) in such work while the public schools are in session.

In Michigan the law permitting a child over 14 to engage in specified employments during school vacation was amended to provide that such employment might be in any occupation "not prohibited by the department of labor and industry as being injurious to health or morals or unduly hazardous for minors between 16 and 18 years of age." The law fixing a maximum 10-hour day (or an average of 9 hours) and 54-hour week for boys under 18 and for all females was amended to include work in hospitals, exempting, however, student or graduate nurses. It is added that exempted employments shall be approved by the commissioner of labor as not injurious to health.

The Minnesota law regulating the employment of children in theatrical exhibitions was strengthened. A bureau for women and

children was created in the New Jersey Department of Labor. New York has made provision for vocational and educational guidance and for the establishment of guidance bureaus as part of the public-school system. Pennsylvania now requires the physical examination of children applying for employment certificates to be made by a physician employed by the school authorities without charge to the child. (Formerly this examination could be made by any physician "approved" by the board of school directors.) Texas passed a law simplifying the precedure in prosecutions of violations of the child labor law.

Michigan amended the clause of its workmen's compensation law which requires double compensation to be paid in case of minors between 16 and 18 years of age injured while illegally employed, so that this penalty applies in all cases of minors under 18 injured while so employed, and North Carolina passed a new workmen's compensation act (formerly the State had no such law) applying to all minor workers whether legally or illegally employed.

A number of exemptions to existing standards were made. Thus in Indiana an amendment to the child labor law exempts golf caddies from the minimum age, hours of labor, night work, and certificate provisions of the law; in Iowa the compulsory continuation school attendance law was amended to exempt high-school graduates from attendance; in Oklahoma the child labor law was weakened by permitting the employment of nonresident children in theaters or other places of public amusement if accompanied by parent or teacher; in Rhode Island the 10-hour day and 54-hour week for girls over 16 and women was amended to exempt employees of public utilities working by shifts during different periods of the day; and in Utah an exemption permits children to be excused from continuation-school attendance if "proper influences and adequate opportunities for education are provided for in connection with their employment."

Information regarding proposed advances in standards which do not become law is difficult to obtain and is necessarily incomplete, but reports of the following bills that failed to pass have been received: A California bill strengthening the provisions of the street trades law (at present California has a minimum age of 10 applying to cities of 23,000 or over, but there is no provision for the badge system, which is the necessary basis for enforcement); Maryland bills to require completion of the eighth grade before a work permit can be issued and to raise the night-work and other standards of the child labor law; Massachusetts bills to extend the age of compulsory school attendance and to increase the night-work restrictions for minors and women; New Jersey and Pennsylvania bills similar to those introduced in several previous legislatures to prohibit the employment of nonresident children during the time when they would be required to attend school in their own States; Pennsylvania bills to reduce the present 9-hour day and 51-hour week for children under 16 to an 8-hour day and 48-hour week, to make the night-work prohibition begin at 6 p. m., instead of 8 p. m., and to improve the administrative provisions of the street trades law; a North Carolina bill to bring children 14 to 15 years of age who have completed the fourth grade under the 8-hour day and 48-hour week law from which they are now exempted, and to reduce the present 11-hour

day and 60-hour week for women and minors to a 10-hour day and 55-hour week; Tennessee bills to regulate the employment of children in street trades (Tennessee now has no such law), to advance the standards of the child labor law by requiring graduation from the eighth grade before leaving school for work, and to strengthen the law in other respects; a Texas bill to raise the age of compulsory school attendance from 14 to 15; a Wyoming bill requiring work permits; and Montana and Wisconsin bills increasing the period of day-school attendance required.

Bills which would have reduced the hours of labor or strengthened night-work prohibitions for women and for girls over 16 years of age failed in Connecticut, Florida, Georgia, Illinois, Maryland, Missouri, Nebraska, New Hampshire, Pennsylvania, Rhode Island, West Virginia, and Wisconsin. A number of these bills would also have reduced the hours of work of girls under 16 in certain employments.

In Colorado, Minnesota, New Mexico, Ohio, and Pennsylvania, amendments to the workmen's compensation laws giving additional compensation to minors injured while illegally employed were unsuccessful; and in Arkansas and Florida, which have no workmen's compensation laws, bills which would have provided compensation for minor as well as adult workers failed to pass.

In some States it was reported that bills which would have lowered existing standards were proposed but not enacted. Among these are the following: An Indiana bill to weaken the standards of the school attendance law; New York and Wisconsin bills which would have lowered the standards of the continuation-school laws; a Maryland bill to permit children over 10 years of age to be excused from school attendance for a limited period for farm work; an Ohio bill which would have weakened the standards of the child labor and education laws applying to children between 16 and 18; and Pennsylvania bills to weaken the night-work standards of the street trades law and to nullify the protection now given to families in labor camps by the rules of the State industrial board.

State and local welfare departments.

Michigan authorized the State welfare commission to call annual meetings of county agents to plan the work of the ensuing year and authorized the counties to pay the necessary expenses of the agents attending these meetings. The Nebraska Department of Public Welfare was given authority to investigate private and charitable institutions. The name of the New Hampshire State Board of Charities and Corrections was changed to the New Hampshire State Board of Public Welfare, and the name of the New York State Department of Charities was changed to the New York State Department of Social Welfare. In Wyoming the duties relating to children, formerly vested in the commissioner of child and animal protection, were transferred to the State board of charities and reform.

New York enacted a comprehensive welfare law providing for county and city public-welfare districts which are given responsibility for the welfare of children in need of public care so far as it is not inconsistent with the jurisdiction of the children's court. The optional county welfare board law of West Virginia was amended so as to make the organization of such boards mandatory. They are to consist of 6 to 12 members and are directed to advise and cooperate

with the State board of children's guardians and act in a general advisory capacity to county and municipal authorities in questions of dependency and delinquency and other social conditions. A comprehensive act known as the Wisconsin Children's Code provides for the establishment of county children's boards in counties of less than 250,000 population to work in cooperation with the State board of control. The measure includes provisions relating to juvenile courts, child-placing and child-caring agencies, maternity hospitals, adoption, and establishment of paternity. The children's boards are to investigate conditions surrounding defective, dependent, neglected, delinquent, and illegitimate children, and may cooperate with individuals and with child-welfare agencies and organizations. They are also directed to make investigations requested by juvenile-court judges.

Bills to create a State department of public welfare in Colorado and Washington failed to pass, as did an Indiana bill to create a board of public welfare in counties of 300,000 or more population, a Nebraska bill to increase the powers of the child-welfare bureau in the department of public welfare, and a Pennsylvania bill providing for the establishment of a welfare board in every city, borough, town, and township.

Public aid to dependent children in their own homes.

Laws relative to public aid to dependent children in their own homes were amended in 12 States (Delaware, Florida, Illinois, Iowa, Maine, Maryland, Michigan, Minnesota, Nevada, New Hampshire, New York, and Wisconsin). Delaware increased from 14 to 16 years the age of children for whose benefit the mothers' pension law applies. Among the changes that were made in the Florida law is the change in the residence requirement from one year in the State to two years in the State, and the placing of full responsibility for investigation of cases with the county commissioners, who are given discretion to use all county agencies for such purposes. Formerly investigations were made by the county boards of public instruction. Michigan also amended the residence requirement. Illinois authorized the State to reimburse counties to the extent of one-half the amounts expended for aid to mothers with dependent children and appropriated $500,000 for this purpose. Iowa amended the law which authorized boards of supervisors in counties of 140,000 or more to levy annually a tax of not exceeding 1 mill, extending this authority to all counties of 80,000 or more. In Maine the law was changed to provide that aid should be paid by the State, which is to be reimbursed by the municipality to the extent of 50 per cent of the expenditure. Formerly the town was reimbursed by the State. The Maryland law provides for a system of mothers' aid throughout the State, applicable to widows with dependent children under 14, and those with children 14 to 16 who are ill or incapacitated for work. The administration of the law is placed in the county commissioners and in the supervisors of city charities of Baltimore city. Minnesota amended the provision relating to the property which constitutes a bar to an allowance. Nevada and New Hampshire increased the maximum amount of allowance authorized and amended the provisions with reference to conditions under which an allowance may be granted. In New York the law was amended so

as to permit aid in New York City on certificate of the commissioner of health, to children of tuberculous parents receiving medical treatment in their own homes. Wisconsin authorized counties of 250,000 to permit food and fuel to be granted needy families as part of or supplemental to the relief granted under the aid to mothers law.

A bill to establish a system of mothers' aid in New Mexico did not pass.

Child-placing and child-caring agencies and institutions.

A number of changes were made in laws affecting child-caring and child-placing agencies and institutions. The California law authorizing the department of finance to transport to proper homes outside the State minor orphans, abandoned children, or those with incapacitated fathers, the counties to pay one-half the cost, was amended so as to remove the limitation placed upon the annual amount of State expenditure. Connecticut specifies that the legal requirements relating to boarding homes for children shall not apply to a person who without compensation is caring for children temporarily and requires the bureau of child welfare to provide for periodical inspections. Iowa amended the definition of boarding homes to include those caring for children under 14 years of age instead of under 3 years, as formerly provided. In Maine the amount required of counties for the maintenance and education of children placed by the State was increased from one-half the cost but not exceeding $2 a week for each child placed by the State, to two-thirds of the amount expended.

In Michigan the State institute commission (a branch of the State welfare department) has been authorized to place in boarding homes children regularly committed to the State public school (for dependent children). The school is to pay the cost of maintenance in boarding homes, which are to be investigated by the superintendent of the school and must report to him monthly.

A Texas law provides for the investigation and licensing of day nurseries, children's boarding homes, child-placing and other agencies caring for children under the age of 15 years by the State board of health, to which these agencies must make reports. Another provision authorizes complaints to the juvenile court if any person having the care or custody of a child placed out and not legally adopted is in the opinion of the board of health an improper person for such care and custody.

California did not pass a bill to increase the amount of State aid for the support and maintenance of orphans, abandoned children, and children of incapacitated fathers. A Connecticut bill which did not pass would have prohibited bringing children into the State for placement without the consent of the board of child welfare and would have required reports of all such children until their eighteenth year. A Missouri bill to repeal the law prohibiting foreign corporations from placing children in the State without guaranty to the Missouri State Board of Charities and Corrections failed to pass.

Adoption, guardianship, and custody.

No important changes were made during the past year in adoption laws. In Massachusetts, Nebraska, Oregon, and Utah the laws were amended with respect to consent required or service of notice of petitions. The New Hampshire law relating to adoption of children by inhabitants of the State was amended so as to permit

any person, whether a resident of New Hampshire or not, to petition a court for permission to adopt a child. The New York law has been amended so that a grandparent may now adopt a grandchild. Maryland passed a joint guardianship law equalizing the parental rights and the custody of the father and mother of a minor child and making them equally chargeable with his care, nurture, welfare, and education. A New Jersey law gives to the mother the right to the custody and control of a child under 14 years of age if the father, though able to support him, fails to do so and leaves him in her care and custody for five years or more.

A New York bill similar to the Maryland law on joint guardianship and Connecticut, Massachusetts, and Michigan bills granting parents equal rights with respect to the services and earnings of their children failed of enactment.

An amendment to the Rhode Island law requiring a court order for the transfer of permanent care and custody of children raises from 14 to 16 years the age of children covered by the law and requires immediate notice to the State public-welfare commission of the placing of a child in a private home. Formerly notice was required only if the child was placed for a period longer than six months.

Juvenile and domestic-relations courts.

Legislation relating to juvenile and domestic-relations courts was passed by a number of States. Connecticut, Florida, New Jersey, North Carolina, and Tennessee created new courts, and in Oregon the domestic-relations court of Multnomah County, formerly an independent court, was made a branch of the circuit court and given new jurisdiction in uncontested divorce suits and in all divorce suits involving children under 18 years of age. New family courts with juvenile and broad adult jurisdiction were established in Mecklenburg County, N. C., and Hamilton County, Tenn. Such courts were also established in every county of New Jresey, where they existed formerly in first-class counties only. New juvenile courts were established in Bridgeport, Conn., and Broward County, Fla. A bill creating a family court in Philadelphia, an Ohio bill to create a domestic-relations division in the common-pleas court of Tuscarawas County, and California, Florida, and Massachusetts bills to create independent juvenile courts in certain communities did not pass.

California made investigation and approval by a probation officer a prerequisite for the filing of a petition of delinquency, dependency, or neglect, except upon order of the juvenile court. Wards of the juvenile court are not to be placed in boarding homes not licensed by the department of social welfare, and the maximum amount to be paid by the county for the support and maintenance of court wards was increased by the same act from $25 to $35 a month. Several other changes in the juvenile court law were also made. New Florida legislation permits the juvenile courts of Hillsborough and Pinellas Counties to be held elsewhere than at the court house at the county seat. An Indiana act for a like purpose permits the juvenile court in Marion County (Indianapolis) to be held elsewhere than in the county court house.

The judge of the Washington County, Md., juvenile court is given increased powers with respect to children declared delinquent, dependent, or neglected and is given discretionary power in the case of any child over 14 who has committed acts which in an adult would constitute a capital or otherwise infamous offense, to waive jurisdiction after investigation and proceed as justice of the peace in an adult criminal case. The definitions of delinquency, dependency, and neglect were also amended. New Mexico has raised the age of delinquency from 16 to 18 years. The New York wayward minors act was amended to include within the definition of wayward minors not only those in danger of becoming morally depraved but also those who are morally depraved. New York also amended the act establishing the children's court of Syracuse as part of the court of special sessions of that city by increasing its jurisdiction to include cases of delinquent, neglected, or physically handicapped children under 16; physically handicapped children 16 to 20 years of age, inclusive (but only for the purpose of ministering to their education, physical care, and treatment); contributing to delinquency or neglect, as well as cases involving matters of adoption, guardianship, establishment of paternity, abandonment, and nonsupport.

The North Carolina law authorizing the juvenile court to commit children to the State board of charities and public welfare or to suitable institutions and agencies was amended so as to permit the board to place children committed to its care with these institutions, societies, and associations. North Dakota gave the juvenile court continuing jurisdiction over children declared delinquent, dependent, or neglected, until they reach the age of 21 years. The law now provides also for a preliminary inquiry in children's cases to include an investigation of the child's home, history, and environmental conditions when practicable. The Ohio law providing for examination by physicians of children dealt with by the juvenile court was amended so as to permit psychological and psychiatric examination and was made applicable to adults as well as children. Ohio also provided for the appointment by juvenile-court judges of juvenile-court referees. Still another Ohio act authorizes a special room to be assigned for the hearing of juvenile cases. Upon recommendation of the judge hearing juvenile cases, county commissioners are authorized to provide a separate juvenile-court building. In Washington, juvenile-court commissioners in counties having no resident judge of the superior court have been given equal powers with the superior court over delinquent, dependent, and neglected children subject to review by the superior-court judge.

Under the new Wisconsin Children's Code the age jurisdiction of the juvenile court, which included dependent and neglected children and delinquent girls under 18 and delinquent boys under 17 years, has been changed to include all delinquent and neglected children under 18 and dependent children under 16.

Idaho and Texas amended laws relating to contributing to delinquency so as to apply whether or not the child has been declared delinquent. The Texas law applies also to contributing to dependency or neglect. Iowa made the law relating to contributing to delinquency applicable also to cases of contributing to dependency and amended the definition of a dependent child.

Maine, which has no juvenile-court system, amended the law relating to neglected children, providing for notice to the State board of children's guardians and for representation of the board at the hearing. The law also authorizes commitment to institutions and agencies at State expense on approval of the State board of children's guardians.

Bills relating to juvenile courts and juvenile offenders were introduced but not passed in a number of States. Among these were the following: A New Jersey bill to prohibit commitment to State prisons of first offenders under 21 years of age not guilty of murder, treason, or kidnapping; a New York bill to raise the juvenile-court age from 16 to 18 and a bill to appoint a temporary State commission to study and investigate the practicability of raising the juvenile-court age from 16 to 18; and a Wisconsin bill which among other provisions would have given juvenile courts in counties of 250,000 or more population jurisdiction over illegitimacy and adoption.

Laws relating to detention were passed in New Jersey, which authorized municipalities having no detention home for juvenile offenders to make contracts with municipalities having such homes, and in Kansas, which provided for the appointment by the juvenile-court judge of matrons of detention homes or juvenile farms for girls, and for advisory boards of five women residents of the county. A Connecticut bill to authorize the use of private homes for the temporary care of delinquent or dependent children in counties where there are no detention homes, or to supplement such homes, failed to pass.

Probation.

California gave to the department of social welfare power to investigate and make reports upon adult and juvenile probation, authorizing an appropriation for such purpose. Minnesota created a probation and investigation department in connection with the district court in counties of 415,000 constituting a single judicial district and prescribed the duties of probation officers including duties required by the juvenile court act. New Jersey enacted a law recommended by the State juvenile and probation study commission appointed in 1927. This measure clarifies the probation laws, empowers courts having jurisdiction over children's or domestic-relations cases to place children and adults on probation for from one to five years, prescribes the powers and duties of probation officers, and provides for uniform methods of precedure. Laws providing for additional probation officers or for increased salaries were passed in California, Kansas, Minnesota, Missouri, Nebraska, and West Virginia. A California act authorizes the appointment of juvenile-court referees in counties of the second class.

The Governor of New York vetoed a bill to establish a medical and psychiatric clinic in the county court of Kings County as part of the probation department of the court. Among other bills relating to probation which failed of enactment were an Indiana bill to substitute a State probation department managed by a commission, for the present State probation officer and advisory juvenile commission. Kansas bills to create the position of State probation officer and authorize the appointment of county probation officers, and a Pennsylvania bill to establish a State probation and parole agency.

Institutions for juvenile delinquents.

Twenty-four-hour schools for predelinquent minors 8 to 16 years of age are authorized by a new California act. These schools are to provide such children with vocational, homemaking, mental, moral, and physical training, and may conduct clinics to diagnose and observe children and advise parents and school authorities as to courses of study or treatment for the normal development of children. Maryland authorized a stock issue for the purchase of sites for parental schools. Florida enacted a law to establish an industrial home in Hillsborough County to care for delinquent and dependent children who become wards of the juvenile court. Illinois increased the amount payable by counties for boys and girls committed to the training school for boys or the industrial school for girls. Another new Illinois law permits courts to commit to the State reformatory for women girls 16 and 17 years of age convicted of an offense and sentenced for 6 months or more. New Hampshire authorized the trustees of the industrial school to provide for light industrial work to be done by the children of the school and to contract for such work, the earnings from which are to be known as "The Boys' and Girls' Benefit Fund." The act requires the trustees to give full consideration to the work so as to avoid commercializing the lives of the children or interfering with the agricultural pursuits of the school.

Bills relating to correctional institutions were considered but not passed in several States.

Offenses against children.

Hawaii, Indiana, Michigan, and Texas increased the penalty for kidnaping, Michigan making the law applicable to the kidnaping of children under 14 instead of the former age of 12. Minnesota amended the law which makes it an offense to take indecent liberties with girls under 14 by making the provision applicable to girls or boys under 16. This measure is to replace a similar measure passed in 1927 but declared unconstitutional. A New York law makes it a misdemeanor, and upon second or subsequent offense, a felony, for a man 18 or over to take indecent liberties with a girl over 10 or under 16. Other measures to increase the age of consent or the penalty in kidnaping and sex-offense cases were considered but not passed in a number of States.

Nonsupport of children.

Desertion of wife in necessitous circumstances or of a child under 16 has been made a felony in Texas. The new act omits requirements included in the old, that the wife be in destitute circumstances or the child in necessitous or destitute circumstances. Connecticut amended the law with respect to suspension of sentence in nonsupport actions.

Ohio authorized payment of 50 cents a day for the maintenance of children of nonsupporting fathers confined at hard labor in the county jail. The law formerly applied only in cases of fathers confined in the workhouse. The Governor of Wisconsin vetoed a bill to authorize the establishment of a prisoners' dependents' fund, in which was to be placed 10 per cent of the excess of the wages of prisoners over the cost of their maintenance.

Bills relating to desertion and nonsupport were introduced but not passed in California, Connecticut, and Maryland.

Children born out of wedlock.

Wyoming passed a law based on the provisions of the uniform illegitimacy act. Six States have now adopted substantially the provisions of this act. In New York the law applying to New York City with reference to children born out of wedlock was amended to conform to the act that is of state-wide application. New Jersey passed an act providing that a child born out of wedlock is entitled to support and education from his father and mother to the same extent as if he had been born in lawful wedlock and providing for methods of enforcing this obligation. Bills relating to the obligation for support and education of children born out of wedlock were introduced but not passed in Minnesota, Ohio, and West Virginia. The Ohio bill would have changed the word "illegitimate" to "born out of wedlock" and would have raised the age of such children for whom support is required of the father from 16 to 18 years.

Physically handicapped children.

Many States considered bills for the treatment and care of physically handicapped children. Four States (Arkansas, Florida, Illinois, and Kansas) provided for a crippled children's commission. The Florida commission is given power to designate hospitals, clinics, or other medical centers for the care, hospitalization, and convalescence of crippled children under 17 years of age, and to pay the expenses therein in cases of indigent or partly indigent children, and an annual appropriation of $50,000 is made. The commission is also authorized to employ orthopedic surgeons, physicians, nurses, and other assistance. The Illinois commission is a temporary commission, consisting of the directors of public health and public welfare and the superintendent of public instruction, to study and investigate hospital, educational, and other conditions pertinent to the welfare of physically handicapped children, and to report its findings to the next general assembly. The Kansas commission, also a temporary commission, is to inquire into and report upon the number, distribution, and condition of crippled children and physically disabled persons in the State and the existing facilities and legal provisions for promoting their care, treatment, education, rehabilitation, and general welfare, and to recommend means more adequate for their needs. The Arkansas commission is to provide proper care, treatment, and education for all crippled children, defined to include physically handicapped persons under 21 years of age, committed to its care by parents or guardians or county or juvenile courts. The commission is also authorized and directed to locate such children by local surveys and to arrange for diagnostic clinics and conferences. In conjunction with the State superintendent of public instruction the commission is to work out ways and means for annual enumeration of all such children from birth to 21, and is to develop plans for a complete State program for corrective education for them. Arkansas also adopted the Arkansas Children's Home and Hospital (an existing benevolent institution) as an official State and county agency for the care of dependent, neglected, and crippled children and appropriated $15,000 for this institution for the ensuing biennium.

Michigan amended and clarified the 1927 act relating to crippled children, provided that hospital charges for care and treatment are to be determined by the crippled children's commission, instead of by the State hospital authorities, and required all hospitals receiving children under the provisions of the act to make reports to the commission. Another Michigan act repealed an early law which authorized boards of education of school districts to establish and maintain schools or classes for crippled children, this matter having been covered by a later law. New Jersey increased from seven to eight the number of members of the crippled children's commission. Tennessee passed a law providing for the care, treatment, and education of physically handicapped or crippled children, including within these terms physically handicapped children under 21, excepting those deaf, dumb, or blind. Several State departments are given duties relating to such children. The State department of health is authorized to conduct public diagnostic clinics and to carry on a State program of convalescent care and follow-up work. The State department of institutions is to arrange for care and treatment of such children in homes, hospitals, or other institutions and to employ in the welfare division a supervisor, trained in social welfare, and necessary assistants. Certain other powers and duties are also vested in the department. The State department of education is to secure and furnish to the health department a list of all physically handicapped or crippled children of school age or younger and is to provide for special classes and for home and bedside instruction; and school enumerators must take a separate census of such children. Wisconsin authorized the establishment of classes for academic instruction in hospitals for crippled children.

In Connecticut a law was enacted providing for State aid of 50 per cent of the cost, but not exceeding $50 a year for any pupil, to each town providing school transportation for children otherwise unable to attend school because of physical defect. Iowa authorized the superintendent of public instruction to study public-school administration and secure data as to physically and mentally handicapped children of school age. Maryland authorized a stock issue to defray expenses of the acquisition of school sites for the instruction and training of physically and mentally handicapped children attending public schools of Baltimore city. Laws providing for a census of physically handicapped children were enacted by Maryland and Oregon. The Maryland law also provides for the examination, treatment, and education of such children 6 to 18 years of age, inclusive, and for State aid for special schools and classes. In Oregon the law relating to the census provides also for educational opportunities for physically handicapped children 6 to 20 years of age, inclusive, and requires parents to enroll their children annually for instruction. A Minnesota act provides for the maintenance of permanent health records of all children of school age, such records to include physical defects that may permanently cripple or handicap the child. The records must be transferred to the board of health when the child ceases to attend school. Another Minnesota act requires every physician and other person attending a child of preschool age or a child not attending school, or observing in a family in which he attends or treats any person, a child suffering

from any defect, injury, or a disease of a continuous nature, or which might permanently handicap the child, to report such child to the health department, indicating cases in which the child or his guardian has not the knowledge or the means to insure the necessary treatment. These reports are to be available to the State children's bureau, which is to disseminate information designed to prevent the permanent crippling or handicapping of children.

Arkansas repealed the 1921 act relating to care, maintenance, and instruction of blind babies and children too small and backward to enter the State school for the blind. New York amended the law naming certain homes and societies to which blind babies and children 12 years or under might be committed as State pupils by authorizing the commissioner of education to appoint such children to any incorporated institutions furnishing care, training, and instruction to such babies and children. An Ohio law which provided that persons received in the State school for the deaf should not be under 7 years of age nor remain longer than 13 years was amended so as to leave age and number of terms of attendance to the discretion of the director of education and the superintendent of the school. Wyoming transferred the care of the deaf and blind from the State board of charities and reform to the State department of education. The asylum for the deaf, dumb, and blind at Cheyenne is changed to the State home for dependent children, placed under the control of the State board of charities and reform, and is to be used for the care of orphans and other dependent children not adequately provided for. Congress authorized the establishment of a children's tuberculosis sanatorium in the District of Columbia.

Measures relating to physically handicapped children which were not enacted into law include an Iowa measure defining physically handicapped children and providing for a census of such children and for their special instruction; a Pennsylvania measure, vetoed by the governor, which would have amended the law providing for an annual census of physically and mentally handicapped children and for the care and treatment of such children, to include children under 21 years of age, and making certain other changes; a Massachusetts bill directing the State department of public welfare to make inquiries and recommendations relating to crippled children; Missouri bills to create a State commission for crippled and handicapped children; and a Washington bill to authorize home instruction for physically disabled children in first-class school districts.

A New York bill vetoed by the governor would have authorized counties to make appropriations for preventoriums or health camps for delicate or undernourished children and those threatened with or predisposed to tuberculosis. In Wisconsin a bill to provide for open-air classes for physically substandard children, and in Wyoming a bill providing for special classes for physically or mentally handicapped school children and for a deputy in the county superintendent's office to do special work with such children in rural schools did not pass.

Mentally defective children.

Laws for the establishment of State training schools for the feeble-minded were enacted in Utah and Wyoming, the law in the

latter State including epileptics within its provisions. A Nevada law requires county commissioners to make provision for the care, education, and support of feeble-minded children. Maine provided for the annual licensing of private hospitals and houses for the treatment of mentally deranged persons. Illinois made the State instead of the county chargeable with the cost of clothing indigent inmates of the school for the feeble-minded.

A California bill to establish city and county boards of mental health and a Missouri bill to create a State department of mental diseases failed of enactment, as did a New York bill for a board of psychiatric examiners in the department of mental hygiene to determine qualifications of psychiatrists. An Indiana bill for an annual report by boards of school commissioners, school boards, or township trustees, of children retarded three years or more was not passed. The bill would have authorized the establishment of special classes for such retarded children. Other bills relating to mental defectives were introduced but not passed in several States.

Laws to authorize the sterilization of mentally defective inmates of State institutions were passed in Arizona, New Hampshire, North Carolina, and West Virginia, as were bills amending existing laws authorizing such action in Delaware, Idaho, Iowa, Maine, Michigan, Nebraska, and Utah. Other bills for the same purpose were introduced but not passed in nine States.

Marriage and divorce.

Marriage requirements received the attention of the legislatures of many States. California, Hawaii, Maine, New York, and Vermont passed laws relating to the ages of minors contracting marriage. California prohibited the marriage of boys under 18 or girls under 16 except upon order of the superior court. Hawaii amended the law which provided for consent of parents or guardians to the marriage of boys under 20 or girls under 18 by making the requirement apply to boys and girls under 20 and specifying that the consent must be written. A new provision requires a 3-day period between application for and issuance of the marriage license. In Maine the written consent of the judge of the probate court is required, in addition to that of the parent or guardian, to the marriage of any person under 16, and in New York the written approval of a children's court judge has been made a requirement, in addition to the consent of parent or guardian, to the marriage of a girl between 14 and 16 years of age. The Vermont law requiring a certificate from a probate, municipal, city, or superior court judge in addition to consent of parent or guardian as prerequisite to the marriage of a boy under 16 or a girl under 14 was amended to apply to a boy under 18 or a girl under 16.

A Connecticut law provides that marriage applications must be open to public inspection and that those filed within five days are to be kept separately and readily accessible. A new North Carolina law applicable to persons under 21 requires a 5-day period between application for marriage license and issuance thereof but authorizes the clerk of the superior court under certain conditions to order issuance before the expiration of this period. Tennessee also provided for a 5-day period between application for and issuance of marriage license, but specified that the requirement might

be suspended by the judge or chairman of the county or probate court and shall not apply if the parent, guardian, or next of kin of the girl states under oath that she is over the statutory marriage age; or if the clerk knows that both of the contracting parties are over the age of 21.

An Oregon bill (passed in 1927 but vetoed by the governor) repealing the 1925 provision that when two persons live together for more than one year and children are born as a result thereof such persons shall be deemed married and such children legitimate, was repassed at the recent session of the legislature and finally signed by the governor. Texas made it compulsory for a man applying for a marriage license to produce a physician's certificate showing freedom from venereal disease. The same law establishes a compulsory period of not less than 3 days nor more than 30 days between application for and issuance of a marriage license.

Other bills relating to marriage applications, notice of intention to marry, age and health requirements, and other provisions of marriage laws were considered but not enacted in a number of States.

California authorized the court in any annulment case to provide for the custody, care, and support of children of the marriage. Michigan authorized the court granting a divorce decree to require a bond from the husband guaranteeing payment of the allowance ordered for the support of minor children of the marriage. Bills in Indiana and Utah relating to custody and support of children in divorce cases failed to pass. An Illinois bill which was not passed would have limited the authority of the circuit court judge to order support and maintenance of married women living apart from their husbands to cases where there are children of the marriage left in the care and custody of the wife.

Recreation.

Minnesota amended the dance hall law by making licenses compulsory for the operation of dance halls in boroughs as well as in cities and villages. Under the new law the licenses must be secured from the county boards instead of the town boards. A new Montana law provides for licensing and regulation of public dances and dance halls outside the limits of incorporated cities and towns in that State. The definition of dance halls in Oregon was amended so as to include tents and other places in which so-called social clubs are operated for profit. The provisions which formerly applied outside any incorporated town or city are now made applicable to towns or cities of less than 500 population. A Wisconsin law makes it unlawful for any person to use indecent, obscene, or profane language in a hall or on the premises where a public dance is being held, or to be guilty of disorderly conduct therein, and provides penalties. Wyoming requires licenses for the operation of public dance halls outside the limits of an incorporated city or town, specifically stating that the dance hall shall be conducted in a quiet and orderly manner, prohibiting the violation in the hall or on the premises upon which the hall is situated of any Federal or State law, and providing for penalties and for revocation of the license. Bills relating to regulation of public dancing were introduced but not passed in several States.

Maryland passed a law conferring additional powers upon the State board of motion-picture censors and providing a new schedule of fees for their services. New Jersey reduced from 16 to 14 years the minimum age at which children may be admitted to motion-picture shows unaccompanied by parent, guardian, or adult friend.

Bills to create State boards of censors were introduced but not passed in Connecticut, New Jersey, North Dakota, Oregon, and South Dakota. An Illinois bill which did not pass would have given the State department of registration and education censorship powers. Measures to repeal the laws creating such boards in New York and Ohio were not enacted. Bills to include talking pictures within the scope of existing laws failed to pass in Ohio and Pennsylvania, and bills amending the laws with respect to age and hours of attendance of children at motion pictures in Maryland and New York, as well as bills relating to producing or taking part in obscene plays or motion pictures in New Jersey, also failed of enactment. A number of States also considered but did not pass bills relating to Sunday showings of motion pictures.

Illinois increased the amount of tax authorized for the establishment of playgrounds in cities exceeding 100,000 population. A new Iowa law authorizes city managers of certain cities to establish and operate swimming pools. Connecticut amended the laws relating to boxing, prohibiting persons under 18 from engaging in professional boxing exhibitions or wrestling bouts and persons under 16 from engaging in amateur boxing exhibitions or wrestling bouts.

EXHIBITS AND RADIO TALKS

During the year 367 shipments of exhibit material, including 3,261 panels, 423 reels of film, 350 slides, 78 film strips, 12 models, and 10 projectors, were sent to National, State, and local organizations in continental United States, Hawaii, and the Philippine Islands to aid them in their efforts to bring child-welfare problems to the attention of the public. These organizations include the American Medical Association and other medical societies, public-health agencies, child-welfare and other social-service organizations, fraternal orders, educational institutions, Young Men's and Young Women's Christian Associations, the American Red Cross, Boy Scout troops, Camp Fire Girls, women's clubs, and State and county fairs. Reports from approximately 60 per cent of the borrowers in the United States show an attendance of 248,600 at the motion pictures and 865,730 at the other exhibits—an average of 93,000 persons reached each month by the exhibits of the bureau, as compared with a monthly average of 76,000 in 1928. In addition to the distribution of graphic material in the United States, the bureau's posters, slides, and motion pictures have been borrowed by child-welfare organizations in Argentina, Brazil, Canada, Costa Rica, England, India, Japan, Paraguay, Turkey, and other foreign countries.

An increased demand for cooperation in radio programs was received by the bureau during the year. A regular series of Wednesday morning radio talks on child welfare was begun by the chief of the bureau on May Day, Child Health Day, and material has been

supplied to various individuals and agencies for the preparation of radio programs on child care.

The bureau is participating in the Ibero-American Exposition at Seville, Spain, which opened May 9, 1929. Its exhibit consists of models illustrating child-health and child-welfare activities; charts describing the organization and functions of the Children's Bureau and its divisions; a mechanical book displaying facts concerning child labor; automatic-slide films on rickets and the care of the preschool child; and the bureau's film, "Sun-Babies." All this material was especially prepared with Spanish legends for the exposition.

REPORTS ISSUED, IN PRESS, AND IN PREPARATION

During the fiscal year 1929, 27 new and revised publications were issued, and in addition the reports of the 45 cooperating States and Territory of Hawaii, from the 1928 report of the administration of the maternity and infancy act, were published as separate leaflets. Three reports were in press at the close of the fiscal year and 28 in preparation.

Reports issued during the fiscal year ended June 30, 1929:

Sixteenth Annual Report of the Chief, Children's Bureau, 1928.

The Promotion of the Welfare and Hygiene of Maternity and Infancy—The Administration of the Act of Congress of November 23, 1921, Fiscal Year ended June 30, 1927. Publication No. 186.

List of Psychiatric Clinics for Children in the United States. Publication No. 191.

Child Labor in New Jersey—Part 2, Children Engaged in Industrial Home Work, by Mary Skinner. Publication No. 185.

Child Workers on City Streets, by Nettie P. McGill. Publication No. 188.

Children in Agriculture, by Nettie P. McGill. Publication No. 187.

Children in Street Work, by Nettie P. McGill. Publication No. 183.

Administration of Mothers' Aid in Ten Localities, with Special Reference to Health, Housing, Education, and Recreation, by Mary F. Bogue. Publication No. 184.

The Child, the Family, and the Court; a Study of the Administration of Justice in the Field of Domestic Relations—Part 1, General Findings and Recommendations, by Bernard Flexner, Reuben Oppenheimer, and Katharine F. Lenroot. Publication No. 193.

Children of Illegitimate Birth Whose Mothers Have Kept Their Custody, by A. Madorah Donahue. Publication No. 190.

Foster-Home Care for Dependent Children (appendix revised). Publication No. 136.

Public Dance Halls; Their Regulation and Place in the Recreation of Adolescents, by Ella Gardner. Publication No. 189.

Dodgers, charts, folders, and leaflets issued during the fiscal year ended June 30, 1929:

Is Your Child's Birth Recorded? Revised October 15, 1928, and April 15, 1929. Dodger No. 3.

Forty-six individual State reports (leaflets) preprinted from The Promotion of the Welfare and Hygiene of Maternity and Infancy—The Administration of the Act of Congress of November 23, 1921, Fiscal Year Ended June 30, 1928 (No. 194, in press).

Keeping the Well Baby Well (revised). Folder No. 9.

Out of Babyhood into Childhood. Folder No. 10.

Why Drink Milk? Milk is the Indispensable Food for Children (revised). Folder No. 3.

Why Sleep? Folder No. 11.

First Regular Employment Certificates Issued to Working Children in 1927.

From School to Work (revised). Folder No. 6.

State Laws and Local Ordinances Regulating the Street Work of Children; a Tabular Summary of Regulations in Effect in the United States. Chart No. 15.

Dodgers, charts, folders, and leaflets issued during the fiscal year ended June 30, 1929—Continued.

Analysis and Tabular Summary of State Laws Relating to Illegitimacy in the United States, in Effect January 1, 1928, and the text of selected laws. Chart No. 16.
A Tabular Summary of State Laws Relating to Public Aid to Children in Their Own Homes in Effect January 1, 1929, and the text of the laws of certain States. Third edition. Chart No. 3.
The Children's Bureau; What It Is, What It Has Done, and What It Is Doing for the Children of the United States.
La Oficina del Niño (Spanish translation of "The Children's Bureau" leaflet).
List of exhibits, January, 1929.
List of publications, January 2, 1929.

Reports in press at the close of the fiscal year ended June 30, 1929:

The Promotion of the Welfare and Hygiene of Maternity and Infancy—The Administration of the Act of Congress of November 23, 1921, Fiscal Year Ended June 30, 1928. Publication No. 194.
Child Labor in New Jersey—Part 1, Employment of School Children. Publication No. 192.[13]
Juvenile-Court Statistics, 1927.

Reports in preparation at the close of the fiscal year ended June 30, 1929:

Seventeenth Annual Report of the Chief, Children's Bureau, 1929.
The Promotion of the Welfare and Hygiene of Maternity and Infancy—The Administration of the Act of Congress of November 23, 1921, for Fiscal Year Ended June 30, 1929.
Child Care (revised).
Growth and Development of Centers of Ossification Observed in the X-rays of Children Examined during the New Haven Rickets study.
The Incidence of Rickets among Children in Porto Rico.
The Incidence of Rickets among a Group of Children under Four Years of Age in Washington, D. C.
Infant Care (revised).
Prenatal Care (revised).
Psychological Study of Some of the Children Covered by the Rickets Demonstration.
Relation of Posture to Physical Fitness.
Child Labor—Facts and Figures.
Child Labor in New Jersey, Part 3—Wage-earning Children of Newark and Paterson.
Children in Fruit and Vegetable Canneries.
First Regular Employment Certificates Issued to Children in 1928.
Vocational Opportunities for Minors: Printing.
Work Histories of Minors of Subnormal Mentality.
Analysis and Tabular Summary of State Laws Relating to Jurisdiction in Children's Cases and Cases of Domestic Relations. Chart No. 17.
The Child, the Family, and the Court; a Study of the Administration of Justice in the Field of Domestic Relations: Part 2, Organization and Administration of Family Courts.
Child Welfare in Selected Counties of Washington.
Institutional Care of Delinquent Girls.
Juvenile-Court Statistics, 1928.
Juvenile Delinquency in Maine.
Recreation in Rural West Virginia.
Youth and Crime; a Study of the Prevalence and Treatment of Delinquency among Boys above Juvenile-Court Age in Chicago.

Folders and leaflets:

Books and Pamphlets on Child Care (folder).
Your Child's Teeth (folder).
Lesson Material on Child Management.
Posture for Preschool Children.

---

[13] Issued Aug. 30, 1929.

DISTRIBUTION OF PUBLICATIONS

The number of publications distributed during the past year was 1,473,430, an increase of 40,572 over the preceding year. The distribution of the popular bulletins on the care of children was as follows:

	1928	1929
Child Care	144,519	158,637
Child Management	48,573	83,072
Infant Care	419,950	432,306
Prenatal Care	159,797	158,583

The 71 per cent increase in the distribution of Child Management indicates the growing interest of parents in methods of handling behavior problems. As usual, the bureau has been unable to meet the demand for these popular bulletins for parents. It has still been necessary to hold to a minimum the monthly allotments to Members of Congress and to health agencies in order that a sufficient number might be reserved to fill requests from individual mothers. The distribution of folders, dodgers, and charts brings the total number of popular publications distributed to 1,307,160, as compared with 1,262,431 in 1928.

With the utmost care to achieve economy in printing and in distribution methods, the bureau has been unable to meet the demand not only for its popular publications but for its more technical publications as well. Small editions of the larger publications and circularization of the mailing lists, with the encouragement of sales, have enabled the bureau's printing fund, which has remained the same for several years, to cover the larger distribution.

State and municipal organizations, as well as private child-welfare agencies, are constantly reminded that the publications of the bureau are for sale, and letters containing money for the purchase of publications are referred to the Superintendent of Documents. The sales of the four popular bulletins are stated by the Superintendent of Documents to have amounted to 265,000 in 1928, and to an equal, if not greater, number in 1929.

The Child Welfare News Summary was issued thirty times during the past year. The News Summary mailing list was revised during the year and now consists of 1,109 names of persons actively engaged in child-welfare work and of child-welfare agencies and publications.

APPROPRIATIONS FOR THE CHILDREN'S BUREAU

The following table shows the appropriations for the work of the Children's Bureau from 1913 to 1930. The 1918 total includes $150,000 appropriated for the administration of the first Federal child labor law; the 1919 total includes $250,000 allotted to the bureau from the President's war emergency fund—$150,000 for Children's Year and $100,000 for enforcement of the child-labor clause in the Government contracts for war materials.

Fiscal year (ended June 30)	Total except for work under maternity and infancy act	For Federal administration of maternity and infancy act	For allotment to States under maternity and infancy act	Fiscal year (ended June 30)	Total except for work under maternity and infancy act	For Federal administration of maternity and infancy act	For allotment to States under maternity and infancy act
1913	$25,640			1922	$271,040	$12,500	$477,500
1914	25,640			1923	311,040	50,000	1,190,000
1915	164,640			1924	311,040	50,000	1,190,000
1916	164,640			1925	325,900	50,354	968,818
1917	164,640			1926	313,000	50,354	949,646
1918	423,760			1927	294,000	50,354	990,000
1919	518,160			1928	300,000	50,354	1,040,622
1920	280,040			1929	317,165	50,354	1,057,646
1921	271,040			1930	320,200		

The bureau has also had the following allotments from the department's printing and contingency appropriations:

Year	Printing	Contingency	Year	Printing	Contingency
1913	$3,500	$3,500	1922	$36,000	$4,350
1914	9,300	4,500	1923	37,500	4,350
1915	15,000	4,350	1924	37,500	4,350
1916	28,000	4,325	1925	39,500	4,100
1917	25,000	4,350	1926	47,000	4,100
1918	25,000	4,350	1927	39,500	4,800
1919	18,000	4,350	1928	44,500	4,800
1920	30,000	4,350	1929	44,500	4,800
1921	36,000	4,350	1930	44,500	4,800

To aid State and local agencies in developing their programs for the prevention of delinquency an increased appropriation is needed at the present time for two purposes, both basic and both in conformity with the theory that the Federal Government should be a fact-accumulating agency for the States. These are:

1. Uniform reporting of statistics by juvenile courts.

In response to requests from students of the subject of delinquency and crime, as well as those responsible for dealing with it—judges, probation officers, State departments of public welfare, and other agencies—the bureau undertook in 1926 to assemble uniform statistics from juvenile courts.

The plan for annual statistics which was worked out in consultation with leading experts was carried out by 43 courts in 1927 and 65 in 1928. The number of courts at present cooperating indicates that more than 100 will report for 1929 and that the number reporting in 1930 will be much larger. In order to keep up with this expanding area and to tabulate promptly the reports made, the bureau must have money for the employment of six additional statistical clerks in the District of Columbia, and two additional agents to visit the courts and help in installing the system. It seems unnecessary to point out that the assembling of these statistics on a national scale can be done only by the Federal Government and that information in this field is second to none in importance.

2. Research in causes and in methods of prevention and treatment of delinquency.

The assembling of comparable information about the courts has revealed differences in numbers, types of offenses, and methods of treatment, the meaning and value of which can be ascertained only by local study.

To make some of these studies and supply the necessary experts for consultation with local courts and agencies interested in the prevention of delinquency, the Children's Bureau should have a corps of experts available. At present it is able to employ these experts for brief periods only. For example, in connection with a study of institutional care as a method of treatment for juvenile delinquents which is being undertaken this year and which will continue for next year also, the bureau is employing a social psychologist who is to direct the work for one month this autumn and for three months next spring. When this study of 10 institutions is completed, the bureau will be asked, as it already has been, to survey institutions in other States with a view to improvement of the institutional practices. This it can not do if it does not have a full-time staff that can be kept on the problem year after year. Without such a staff real results can not be expected in child culture any more than in agriculture.

The bureau needs for this work funds for 3 additional specialists in child delinquency—a psychiatrist, a psychologist, and a social investigator experienced in this field—together with the necessary clerical and other assistants.

A specialist in recreation should also be included, because recreation plays so important a part in a program for prevention of delinquency. The bureau has one such specialist. Her time has been promised a year in advance, and more requests for help in planning recreation and instruction of rural and small-town leaders during the coming year have been refused than have been accepted. Many more requests would have been received except that the State agencies are advising inquirers that it is useless to write the bureau, as engagements can not be made more than the one year in advance.

Respectfully submitted.

GRACE ABBOTT, *Chief.*

○
