EIGHTEENTH ANNUAL REPORT

OF THE

CHIEF OF THE CHILDREN'S BUREAU

UNITED STATES DEPARTMENT OF LABOR,
CHILDREN'S BUREAU,
Washington, September 15, 1930.

Hon. JAMES J. DAVIS,
Secretary of Labor.

SIR: I have the honor to transmit herewith the eighteenth annual report of the Children's Bureau, for the fiscal year July 1, 1929, to June 30, 1930.

The Children's Bureau has to report an unusually large volume of work during the past year, which has been along four main lines: (1) Scientific studies of child health, child labor and vocational guidance, recreation, dependency, delinquency, and neglect; (2) assembling and interpretation of current statistics and information in the field of child welfare; (3) preparation and distribution of popular and technical bulletins on maternal, infant, and child care and child welfare; and (4) assistance to State child-welfare commissions, State and county departments or divisions concerned with child welfare, and private child-health and child-caring agencies, through consultation or joint undertakings.

MATERNAL AND INFANT HEALTH

Final work in connection with administration of maternity and infancy act of 1921.

The maternity and infancy act of 1921, as amended by Congress in 1927, came to an end on June 30, 1929. As the comptroller ruled that all State accounts must be audited after this date, the 45 cooperating States were visited by the auditor of the maternity and infant-hygiene division of the bureau, and State books and vouchers were carefully checked. The final financial statements submitted to the bureau were audited in Washington. The activities reports of the States were summarized, and the annual report of the administration of the maternity and infancy act for 1929 prepared.

A review of the annual reports of the administration of the maternity and infancy act shows the following permanent work resulting from the act:

1. Expansion of the birth and death registration areas.—Since statistics as to births and deaths are essential for planning and evaluating a maternity and infancy program, a special effort was made by the Children's Bureau and by the maternity and infant-hygiene divisions in the States to improve registration. The expan-

sion of the birth-registration area from 30 States and the District of Columbia in 1922, representing 72 per cent of the total estimated population of the United States, to 46 States and the District of Columbia in 1929, representing 95 per cent of the total estimated population of the United States, was, at least in part, one of the results of the maternity and infancy act.

2. Establishment of State child-hygiene bureaus or divisions.—Previous to 1920 child-hygiene bureaus or divisions had been established in 28 States, 16 of them in 1919, largely as a result of the Children's Year activities sponsored by the Children's Bureau.

In anticipation of the passage of the maternity and infancy act 9 States—Alabama, Delaware, Maine, Michigan, Mississippi, Nebraska, Oregon, South Dakota, and Washington—created child-hygiene divisions or bureaus so as to be ready to receive funds and carry on the work. After the passage of the act 10 States—Iowa, Maryland, Minnesota, Nevada, New Hampshire, North Dakota, Oklahoma, Tennessee, Utah, and Wyoming—and the Territory of Hawaii organized such divisions or bureaus, the States in 1922 and Hawaii in 1925. All these are functioning now except the one in Nevada.

3. Permanent health centers.—During the period July 1, 1924, to June 30, 1929, the States cooperating reported that as a result of aid given through the maternity and infancy act 1,594 permanent local child-health, prenatal, or combined prenatal and child-health consultation centers were established, as follows: Alabama, 19; Arizona, 10; Arkansas, 14; California, 89; Colorado, 21; Delaware, 9; Florida, 35; Georgia, 42; Idaho, 2; Kentucky, 52; Louisiana, 34; Maryland, 7; Michigan, 30; Minnesota, 8; Mississippi, 8; Missouri, 26; Montana, 15; Nebraska, 1; Nevada, 1; New Hampshire, 8; New Jersey, 70; New Mexico, 20; New York, 132; North Carolina, 37; North Dakota, 3; Ohio, 23; Oklahoma, 5; Oregon, 57; Pennsylvania, 167; Rhode Island, 7; South Carolina, 11; Tennessee, 29; Texas, 224; Utah, 133; Virginia, 80; Washington, 21; West Virginia, 66; Wisconsin, 64; and Wyoming, 14.

In States where county organization was emphasized and full-time county health units were being established nurses, and sometimes doctors, were added to the staff of the county unit in order to make more effective or to demonstrate a county maternity and infancy program. For example, in Alabama the number of local nurses prior to 1922 was 36 (28 white, 8 negro); in 1926 there were 74 nurses (58 white, 16 negro). Of this number, 34 were paid in part by maternity and infancy funds. In many counties the demonstration work of a maternity and infancy nurse working from the child-hygiene division of the State department of health resulted in the employment of a locally supported county nurse to continue the work. In Georgia, for example, where 28 county nurses were paid jointly from State and Federal funds, the State reported that 21 of the nurses were taken over and financed by the counties after July 1, 1929.

4. Great increase in State appropriations.—In addition to the increased local appropriations, making it possible to assume the support of local consultation centers and public-health nurses, the State appropriations have greatly increased, at first in order to match

Federal funds and later, when the Federal funds were no longer available, in order to continue or to expand the State program. Thus 19 States and the Territory of Hawaii have reported that their legislatures have appropriated for continuing the maternity and infancy work after the expiration of the maternity and infancy act, an amount equaling or exceeding the combined State and Federal funds under the act. These States are: Delaware, Kentucky, Maine, Maryland, Michigan, Missouri, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Pennsylvania, Rhode Island, South Dakota, Tennessee, Vermont, Virginia, and Wisconsin. Moreover, Florida, which has a special tax levy, reports that the full program carried on with Federal assistance is being continued.

Pending maternity and infancy legislation.

When Congress adjourned in July, 1930, there were pending in the Senate two bills, S. 255 and S. 4738. The former proposes to continue the maternity and infancy act of 1921 with some amendments, and the latter is a combination, again with some amendments, of S. 255 and the Capper bill, S. 878, for the promotion of the health of the rural population of the United States. Bills identical with the Senate bills have been introduced in the House as H. R. 1195 and H. R. 12995. In addition, three other House bills on this subject have been introduced, one of which, by Representative Goodwin of Minnesota, proposes the reenactment and extension to Porto Rico of the Sheppard-Towner Act. There is very general support of S. 4738 and H. R. 12995 as affording a satisfactory basis of developing in a coordinated way the county-unit organization for promoting the general health and the special maternal and child-health program which experience has shown to be necessary. These bills propose to give the administration of the former to the Public Health Service, and of the latter to the Children's Bureau, with a Federal health coordinating board composed of the Surgeon General of the Public Health Service, the Chief of the Children's Bureau, and the Commissioner of Education given authority to approve the plans in each field.

Institutes and short courses for doctors.

In 1929 the bureau cooperated with the department of obstetrics of Emory University and the State Board of Health of Georgia in giving for physicians in active practice a short intensive course in the principles and practice of obstetrics. The plan was suggested and approved at a meeting of the bureau's obstetrical advisory committee, on the theory that for permanent improvement in obstetric mortality and morbidity it was necessary not only to have adequate teaching of the fundamentals of obstetrics in medical schools but to provide short intensive courses for doctors in active practice. The first courses were regarded as experimental. They were well attended and much appreciated by the physicians. At the urgent request of the State board of health, courses were given in 17 centers in the State during the past year, and more than 600 doctors attended. In addition, a special course for negro doctors held at Emory University in Atlanta was attended by 75 negro physicians.

At the request of the State Board of Health of Florida plans have been made for a similar series in that State.

RESEARCH IN MATERNAL AND CHILD HEALTH

Study of maternal deaths.

The field work for the study of all maternal deaths in 15 States, planned in 1926, has been completed and the tabulations begun. Case histories of the 7,537 deaths, representing 26 per cent of all maternal deaths in the birth-registration area in 1927 and 1928, the two years covered by the study (except in two States in which 1928 only was covered), were secured by physicians on the staff of the bureau or of the child-hygiene divisions of the State departments of health. As the States included were Alabama, California, Kentucky, Maryland, Michigan, Minnesota, Nebraska, New Hampshire, North Dakota, Oklahoma, Oregon, Rhode Island, Virginia, Washington, and Wisconsin, it can be said that conditions in every section of the country will be reflected in the findings. Eighty-two per cent of the deaths for which case histories were secured were of white women and 18 per cent of colored women. In the birth-registration area, for the years covered, 19 per cent of the maternal deaths were of colored women, so that the racial factor can be considered adequately in the conclusions and recommendations.

This study was planned with the assistance of the bureau's obstetrical advisory committee and carried out in cooperation with the State department of health and the State medical society in each of the 15 States included in the study. Preliminary summaries of findings in Kentucky and Oklahoma and final reports of the findings in North Dakota and Rhode Island were given during the year to the departments of health and medical societies of these States. It is expected that the tabulations and analysis of the material will be completed in 1931. Similar studies are being conducted by the New York Academy of Medicine in New York City and by the division of maternity and infant hygiene of the State University of Iowa, and one in Cleveland is being planned. In these the Children's Bureau is not making the study, but its schedules and definition of terms are being used so that findings will be comparable with those of the Children's Bureau study.

New Haven and Porto Rico rickets studies.

The tabulation and statistical analysis of the material collected in the New Haven rickets study and the study of the health of infants and preschool children in Porto Rico have continued, and several reports based on this material will go to press during the fiscal year 1931.

New Haven study.—Tabulation of the New Haven material has followed certain definite lines. Two groups of children have been considered separately, those who were examined repeatedly, known as the "series" cases, and those who were examined but once, known as the "nonseries" cases. The series cases represent in very large part those children who received antirachitic treatment in the form of cod-liver oil and sunlight, the nonseries children, those who had received little or no cod-liver oil and whose mothers had not been instructed to give sun baths. Throughout the tabulation males and females and white and negro children have been considered separately.

Social and economic data having a bearing on the development of rickets were collected for the series and nonseries groups, including information regarding total family income, its source, and the number of persons maintained by it; information regarding the size of the family, the total number in the household group, and the number of rooms occupied by the family; information regarding the father's occupation and the mother's work during the periods of pregnancy and lactation; information regarding the age of the mother at the birth of the child, the number of pregnancies of the mother, the number of miscarriages and stillbirths, prenatal care, illnesses and diet during pregnancy, and diet during lactation; and information regarding any family history of tuberculosis and syphilis. These data are being studied in relation to the diagnosis of rickets at the time of the single examination in the case of the nonseries group, and in relation to the maximum amount of rickets shown by the series children.

Since the prevention or control of rickets was the main purpose of the investigation, special attention is being given to the earliest manifestations of the disease. The age incidence of rickets, as shown by clinical and Röntgen-ray examination, is being studied for both series and nonseries groups. Study of rickets in the nonseries group gives a picture of the incidence and the severity of the disease in untreated white and negro children from 1 to 60 months of age living in a southern New England city and examined at various seasons of the year. Study of the series group shows the age incidence and the severity of the disease in a group of children, white and negro, who were followed from the earliest months of life and given more or less antirachitic treatment. The series cases have been summarized to show the age of first observation of Röntgen-ray rickets and the duration of the Röntgen-ray evidence of the disease in relation to various factors which may influence its early appearance or its prolongation, such as race, sex, rate of growth, amount of cod-liver oil taken, diet, and tanning of the skin.

In the series group study is being made of the incidence of rickets, both clinical and Röntgen ray, in successive age periods. The first two years of the child's life have been divided into 3-month periods, and the data relating to rickets have been so tabulated that the findings for any period may be compared with those for any other period. The data available for study in each of these 3-month periods include the maximum and final clinical and Röntgen-ray diagnoses of rickets, the amount of cod-liver oil taken, the diet, the deviation in weight from the average weight for height and age, and the presence of tanning of the skin at any time during the period. In addition, the rates of growth in height and weight (average monthly percentage of increase) from 1 to 6 months and 7 to 12 months are available for all children having four or more physical examinations during these 6-month periods, and these rates can be related to all data presented for the 3-month periods. The data on the month of birth, weight at birth as reported by mother, the maximum clinical and Röntgen-ray diagnoses of rickets during the entire period of observation, and the mother's diet during pregnancy and lactation are also available and can be correlated with the data for any of the 3-month periods. Tabulations have been made showing the relation

of the rickets diagnoses in each 3-month period to the amount of cod-liver oil taken, the diet, the presence of tanning of the skin, the rate of growth, and the deviation from average weight for height and age, not only in the period under consideration, but also in contiguous periods.

Certain data have been summarized for the first 9 months of life, for 10 to 15 months of age, and for 16 to 24 months. The maximum diagnosis of rickets in each of these longer periods has been tabulated with the antirachitic, dietary, and growth factors, and the motor development of the child. The physical-examination data also have been so edited that the maximum degree of certain of the generally accepted clinical signs of rickets can be studied in relation to the antirachitic and growth data. The illnesses that may bear some relation to rickets, such as respiratory and gastrointestinal diseases, have been summarized for use in association with the data of these longer periods.

All the New Haven rickets tables prepared during the past year have been analyzed statistically with a view to showing just which factors in the history of the child are significantly associated with Röntgen-ray and clinical evidences of rickets. It has been found that Röntgen-ray rickets occurred to a significant extent among the negro children in the study more frequently than among the children of south European stock, and more frequently among children of south European stock than among the other white children primarily of north European stock. The males tended to have rickets more than did the females. Rickets that is demonstrable by Röntgen ray is seen most frequently in the first two years of life, about one-third of the nonseries children of 2 years and under reporting Röntgen-ray evidence of rickets as compared with only 8 per cent of the children 25 to 60 months of age.

The average monthly percentage of increase in height and weight was computed for all those children examined frequently enough for an estimate to be made. Two hundred and eighty-eight children furnished enough material for computation of rates for the first six months of life. It was found that the children with Röntgen-ray evidence of rickets in the first year grew significantly faster in weight and height than the children whose Röntgen-ray diagnoses were negative or doubtful. Rapidity of growth is also significantly associated in the children studied with the season of birth, those children born during the first half of the year growing significantly faster both in height and in weight than those children born from July to December, inclusive. The males and females grew at approximately the same rate during the first six months of life. No significant differences were found between the white and the negro children in the rate of increase in weight. The negroes, however, grew significantly faster in height than did the white children.

From the New Haven Röntgen-ray examinations of the short bones of the wrist and similar material from the Porto Rico study later described, a report on carpal centers of ossification as one index of growth has been prepared. This report is in two sections, the first describing (1) the order of appearance of the various carpal centers of ossification; (2) the time of appearance with special reference to sex differences; (3) the unilateral appearance of centers, or the

asymmetrical development of centers in the right and left wrists; and (4) the comparative development of siblings with special reference to twins. The second section shows the relationship between the number of these centers and such factors as age, height, and weight in sex and racial groups and also examines their relationship with certain other indexes of development and with the occurrence of rickets.

Porto Rico study.—The report of the Porto Rico rickets study is nearing completion. It has been planned to cover certain aspects of health, in addition to data on rickets, and will include a short description of local conditions in Porto Rico which are pertinent to the study, a discussion of the health of children as indicated by morbidity and mortality statistics, a description of the children studied and methods used, a section on growth and general physical condition of the children studied, and a detailed discussion of the incidence of rickets, evidences of the disease found in Röntgenograms of the arm bones and at physical examination, and the relation of these evidences to various other factors. Material on social and economic conditions in the families of the children and on diets will also be included.

Stillbirths and neonatal mortality.

With the decline in deaths of children 1 month to 1 year old, the relative importance of stillbirths and deaths during the first month of life has increased. It is estimated that there are approximately 75,000 neonatal deaths each year in the United States of America and that the annual loss due to stillbirths totals 100,000.

The Children's Bureau in recent years has assisted the department of obstetrics of the University of Minnesota in a study of autopsy records of stillborn infants and of live-born infants dying within the first two weeks of life; tabulation of 1,000 such records has been completed by the statistical division. These records give information on the prenatal, natal, and neonatal history of the child, the physical measurements and autopsy findings, and the history of the pregnancy and the natal and postpartum history of the mother.

The bureau also has had the cooperation of the Yale University School of Medicine in a study in New Haven of the causes of neonatal morbidity and mortality. Four hundred newborn infants were examined in 1930, which, with the number examined during 1928 and 1929, makes a total of 1,001. The information on these 1,001 cases is being prepared for analysis, which will follow certain general lines relating the natal and neonatal history of the child to the prenatal and natal history of the mother. All infants, whether stillborn or live born, whether living through the first month of life or dying in that month, will be studied in relation to: (1) Whether or not the mother had prenatal care, and if so, how satisfactory it was; (2) the complications of pregnancy; (3) the duration of pregnancy; (4) the hygiene of the mother during pregnancy, including her diet (especially the quantity of milk), the amount of sleep, rest, exercise, and outdoor sunlight which she took, the amount of time spent in gainful occupation or in work in her own household; and (5) the obstetrical history of labor and delivery, including duration of labor, type of delivery, and complications of delivery. Special analyses of the histories of those infants who were stillborn and of those who died in

the neonatal period are being made to determine as far as possible the cause of death. Autopsy material also is being carefully studied. The findings will be considered in connection with the whole group. Special study also will be made of the premature infants. In connection with this, all infants have been grouped according to certain body measurements as to whether they were mature, premature, or immature (having border-line measurements), and these groups will be studied with respect to prenatal and natal history. The study has been an exploratory one with a view to discovering what the evidence shows as to further intensive studies which might profitably be undertaken. The data secured for these infants are now in process of tabulation and analysis with this end in view, as well as for the purpose of determining the conclusions that can be drawn from the facts assembled in the course of this investigation.

Popular bulletins on child health.

The preparation of popular child-health bulletins for parents has continued. In 1930 Infant Care, completely revised, has been published. The manuscript of the new edition of Prenatal Care has been reviewed by the members of the obstetrical advisory committee and has been sent to press. The new edition of Child Care (Publication No. 30), which will be published under the title "The Child from One to Six—His Care and Training," is nearing completion. The bureau's pediatrics advisory committee met in June and carefully checked the sections prepared since the last meeting of the committee. It is hoped that this bulletin will go to press early in the fiscal year 1931. A revision of the bulletin Child Management is also under way.

A new popular folder, Your Child's Teeth, written by one of the leading dentists of the country, has been published. A folder on posture for the preschool child and one on avoiding harm are in preparation. A pamphlet containing a set of lessons on child management has been prepared and is now in press.

INJURED MINORS UNDER WORKMEN'S COMPENSATION LAWS

During the past year the principal undertaking of the industrial division has been the study of work accidents to minors, with special reference to the administration of compensation laws as affecting minors both legally and illegally employed. Under some State laws minors injured while illegally employed are not entitled to compensation, under others they are entitled to the same compensation as the legally employed, and under a few laws they are given compensation increased by 50 to 200 per cent over that given to the legally employed.

As Indiana is one of the 16 States which exclude from compensation minors who are illegally employed, a study was made of a group of such minors who had met with industrial accidents. Its purpose was to ascertain what attempts, if any, they had made to obtain indemnity through the courts and what success they had had in these attempts, and also to learn what had happened in the cases of those who had not sought court aid. Information for the study was obtained through an analysis of the accident records of the State industrial board, under whose jurisdiction the workmen's compen-

sation act of that State is administered; through court records; through personal interviews with a number of the injured minors themselves, including all that could be located whose accidents were serious enough to cause permanent disability or temporary disability of at least 28 days; and through personal interviews with the parents of those who suffered fatal injuries.

The study covered a period of 4½ years—from October 1, 1924, to March 31, 1929—and included a period of 14 months—from December 1, 1924, to February 1, 1926—when through a legal provision that was first declared unconstitutional and later repealed, minors illegally employed not only were covered with other workers by the workmen's compensation act but were awarded double compensation for their injuries. It was not possible to extend the study over a longer period because all records of accidents occurring previous to October 1, 1924, had been destroyed. The number of minors injured while illegally employed during this period was 822, of whom 148 were injured in the 14 months in which such minors were entitled to double compensation, and 674 during the period in which such minors were excluded from the benefits of the compensation law. One hundred and thirteen of these 822 illegally employed minors were personally interviewed by a representative of the Children's Bureau; 33 had been entitled to double compensation, and 80 were excluded from the benefits of the compensation law.

Ninety-seven per cent of these 822 injured minors were illegally employed because their employment had violated the employment-certificate requirements of the law as interpreted by the industrial board; 83 per cent because of violation of this one provision only; 14 per cent were in prohibited occupations, almost all of these being employed in violation of sections of the law relating to the issuing of work permits as well. In only five instances in the entire group were reports received of violations of provisions relating to hours of labor; but more than were reported may have occurred since employers are not required to state the working hours of the injured person, and it was only when the hour of the accident given in the initial report showed some irregularity that such violations were discovered.

Under a specific provision of the child labor law duplicate copies of all employment certificates issued throughout the State to children between 14 and 18 years of age must be sent by issuing officers to the industrial board. They are filed in that office, and all accident reports in which the age of the injured worker is reported as under 21 years are checked to this certificate file as they are received and the age verified. If no certificate is found for the injured minor, further attempt is made through letters to the issuing officers in the town in which he lives to verify his age through the records of the school census, which is taken annually in Indiana and includes all persons under 21 years of age. In some instances letters are written to employers as well. No further attempt is made to verify the ages; and, owing to the fact that many of those included in the study had never obtained employment certificates and that a search of the school-census records yielded no information concerning them, the ages of only a part of the group (59 per cent) were ascertained.

Of the 482 minors whose ages had been verified by the board, 78 per cent had been reported by the employer as older than they were. More than one-fourth were reported as 2 or more years older, and 21 minors (4 per cent) as at least 3 years older. While the large majority (64 per cent) of those whose ages were verified were 17 years of age, 28 per cent were 16 years old, and 8 per cent were below that age. Although almost three-fourths of these young workers had been represented at the time of the accident to be 18 years of age or older, it was found as a matter of fact that only one worker in the entire group had reached 18. Furthermore, although only 17 of the 482 minors whose ages were verified were reported to be under 16 years old, 39 were under that age.

It is sometimes argued that it is to the interest of the illegally employed minor to be excluded from the benefits of compensation, as he may obtain through court proceedings heavier damages than he would be entitled to under the compensation acts. Such a theory presupposes that the minor is aware of his rights under the common law, that he is financially able to institute court proceedings or can find a lawyer who will serve him on a contingent basis, and that he can tide himself over the period of delay incident to court proceedings. It was found that of the 80 minors interviewed whose accidents had occurred prior or subsequent to the comparatively short period in which illegally employed minors were included in the provisions of the workmen's compensation act, only 7 had instituted civil suits, and 5 others had employed lawyers who effected a compromise agreement. Eighteen received no redress whatever for their injuries; and though 62 had received some indemnity or had been paid their regular wages, 54 of these received no more than they would have been entitled to under the compensation act. The study revealed ignorance on the part of the injured minors of their rights under the law. Almost one-third of those interviewed stated that at the time of the accident they knew nothing whatever about the workmen's compensation law, or their right to institute civil suit, and one-fourth that they knew only vaguely that they "ought to get something." The remainder were familiar with the provisions of the law as they applied to legally employed workers, but only one minor in the entire group was aware at the time of his injury that illegal employment affected his status under the law.

Available information in a few other States where illegally employed minors are in the same position under the law as in Indiana confirms the findings in Indiana. In Illinois, of 55 minors under 16 years of age injured in industry during the year 1923 (previous to the enactment in that State of an amendment to the workmen's compensation law providing for additional compensation to illegally employed minors) only 3 received more indemnity for their injuries than they would have received if they had been covered under the workmen's compensation act, and 6 received no redress whatever. In Pennsylvania, another State in which illegally employed minors are excluded from the benefits of the compensation act, it was found that of 83 illegally employed minors injured in the 6-month period from July 1 to December 31, 1926, only 1 received more than he would have been entitled to if he had been covered by

the law, and 6 failed to receive anything whatever by way of indemnity.

Wisconsin was the first State to enact legislation providing that minors injured while illegally employed are entitled not only to compensation but also to an amount in addition to the sum regularly granted. Its law provides that a child under permit age and illegally employed, or a minor of permit age or over who is injured when employed in an illegal occupation, shall receive treble compensation (200 per cent additional) and that a minor of permit age employed without a permit shall receive double compensation (100 per cent additional), this additional compensation to be paid by the employer. Additional compensation is not awarded in Wisconsin in the case of minors employed in violation of the hours-of-labor and night-work provisions of the child labor law.

Information regarding the operation of this provision has been obtained through a study of the records of such cases occurring from the time this law became effective on September 1, 1917, to December 31, 1928. Records for 970 cases occurring in this period were studied.

Employment without the work permit required by law for minors under 17 was the most common type of violation for which the penalty of increased compensation had been imposed upon Wisconsin employers, this type of violation having been found in 91 per cent of the cases for which information as to the nature of the violation is available. In 63 per cent of the cases failure to have the requisite permit was the only type of violation reported. Twenty-seven per cent were employed in prohibited occupations. Since, as has been stated, minors employed in violation of the laws relating to hours of labor and night work are not covered by the Wisconsin extra compensation law, no cases of violations of this sort were included.

The Industrial Commission of Wisconsin follows the same procedure as the Industrial Board of Indiana in checking the names of injured minors (those under 18 in Wisconsin, those under 21 in Indiana) against the files of duplicate employment certificates—which in both States are by law required to be filed with these State agencies—but the Wisconsin commission is much more thorough in its search to ascertain the minor's actual age. In consequence, information as to their actual age had been ascertained for a much larger percentage of the illegally employed minors in Wisconsin than in Indiana—97 per cent in the former as compared with 59 per cent in the latter.

The minors who had received increased compensation ranged from 12 to 17 years of age, inclusive. Fourteen of them (including 2 boys of 12 and 12 boys of 13 years of age) were under 14. Two-thirds of the entire number were 16 years of age. The great majority (95 per cent) were of permit age (under 17), but 52 minors (6 per cent) were 17, their employment in the occupations in which they were injured being illegal for their age.

In two-thirds of the cases the minor's age had been stated incorrectly by the employer in reporting the accident, his age being given as older than it actually was at the time of injury in practically every such case (629 out of 631). Practically half (48 per cent) of these 629 minors were reported as two years or more older than they

actually were—12 per cent at least three years older, and a few four or five years older. On the employers' reports of the accidents occurring to the entire group of minors found by the industrial commission to be illegally employed, two-thirds (65 per cent) were stated to be 17 years old or more and one-fourth (27 per cent) 18 or older; actually only 6 per cent were 17, and none was as old as 18.

Fatal injuries had occurred to 13 (1 per cent) of the 958 illegally employed minors awarded increased compensation for whom information as to the extent of disability was available, and permanent injuries to 143 (15 per cent) of this number. The proportion receiving fatal or permanent injuries was greater among the illegally employed group than among the total number of minors under 18 compensated for industrial accidents in the decade 1919–1928 in Wisconsin (16 per cent as compared with 10 per cent). The proportion receiving fatal or permanent injuries is exceptionally high—almost one-fourth (23 per cent)—among the illegally employed minors under 16 years of age, of whom 3 (1 per cent) were killed and 57 (22 per cent) were permanently injured. The corresponding percentages for the total number of minors under 16 receiving compensation in the decade 1919–1928 were only 1 per cent and 11 per cent, or 12 per cent together.

As might be expected, fatal and permanent injuries were far more common among the minors employed in prohibited occupations than among those employed in violation only of the permit law. Fatal accidents occurred to 2 per cent of the former and permanent injuries to 25 per cent, as compared with 1 per cent and 10 per cent, respectively, of the latter group. Injuries causing only temporary disability were also somewhat more serious among the minors working in prohibited occupations than among those employed in violation only of the permit law, 33 per cent of the minors suffering temporary disabilities in the former group as compared with 29 per cent in the latter group having been disabled for 28 days or more, and 5 per cent of the former as compared with 2 per cent of the latter having been disabled 12 weeks or more.

Analysis of these records shows the benefits that may accrue to minors injured when unlawfully employed, under a well-enforced law providing for increased compensation in such cases. All but one of the injured minors had received the ordinary compensation to which they were entitled, and all but seven had received the additional indemnity due them because of their illegal employment. These seven minors had not received this additional amount for the reason that they could not be located or because of other reasons for which the administrative agency could not be held responsible. Additional compensation paid by employers to individual minors ran up to $6,000 and over, 88 minors (9 per cent) of the total number receiving as much as $500 and 54 (6 per cent) receiving $1,000 or more. The average amount of compensation paid to these minors was $380.20, of which $243.37 was paid as additional compensation by the employer, the total amount of additional compensation paid by employers for these 958 accidents being over $200,000. The advantages to injured minors under such a law, when effectively administered, are evident when comparison is made of the amounts paid

to the minors receiving relatively serious injuries in Wisconsin and Indiana. In Wisconsin the average total amount received by the children or the dependents of children whose injuries had proved fatal or had resulted in permanent disability or temporary disability for 28 days or more was $845.41; the average amount received in the corresponding group of injured minors (not covered by the compensation act) interviewed in Indiana was $368.34. Moreover, of the 80 children interviewed in Indiana who had received relatively serious injuries, 26 received no money indemnity at all, while in Wisconsin, as has been pointed out, every injured child subject to the act but one received compensation.

Not only is such a provision for increased compensation as is found in the Wisconsin law of benefit to the minor in giving him more adequate compensation for injuries received while employed in violation of the child labor law, but it may also serve as a strong incentive to the employer to comply with that law, since the employer himself must pay the excess indemnity.

In connection with this inquiry into the status of injured minors under the workmen's compensation laws, a special study is being made of the various State laws and of related decisions of State courts and compensation commissions. Also under way in the industrial division of the bureau is an analysis of the available statistics of industrial injuries suffered by minors in the various States, made with a view to obtaining information regarding accidents to minors of different ages and employed in different occupations, as compared with those to adult workers. Supplementing these inquiries, a study is being made of the existing laws and rulings excluding minors of different ages from occupations deemed to be especially hazardous.

PREVENTION AND TREATMENT OF DELINQUENCY

The most important piece of work relating to juvenile delinquency undertaken during the fiscal year 1930 has been a study of the results of institutional treatment provided for delinquent boys in State industrial schools. Some 10 schools will be studied before the investigation is completed. During 1930 surveys of State schools in California, Michigan, Ohio, Pennsylvania, and New Jersey were made by a specialist in institutional care, who studied their equipment, the standards of care given, and the opportunities for training provided. A field staff made detailed case studies of the boys who had been discharged from the California institution and released from parole supervision for three to six years prior to the study. The purpose of these case studies was to investigate the influence which the boys' experience in the State school and on parole has had on the adjustment or lack of adjustment of their conduct difficulties. The schedules used include a history of the boy's social environment, problems, activities, and conduct from the time he first came before the juvenile court to the time when he was interviewed by one of the field agents of the bureau. At the close of the year the field agents were making similar case studies of boys discharged

16610—30——3

from the Michigan school, and studies will be made in other States during the coming year.

During the summer of 1929 the Chief of the Children's Bureau, at the request of the National Commission on Law Observance and Enforcement, met with the commission to discuss what it might do on the subject of juvenile delinquency. At the request of the commission a memorandum summarizing available material on extent, causes, treatment, and prevention of juvenile delinquency was prepared by the assistant to the chief for its committee on juvenile delinquency. This memorandum has also been used by the committee on delinquency of the White House Conference on Child Health and Protection.

RECREATION

While recreation, particularly outdoor recreation, is an important part of a health program, it is also fundamental in promoting right social relationships, and the recreation specialist of the Children's Bureau for this reason has been assigned to the social-service division of the bureau. During the past year she has devoted a large part of her time to the problem of recreation among rural children. At the request of the extension divisions of the Federal and State departments of agriculture, demonstrations were given to 4–H Clubs and other rural groups in 12 States and at the national 4–H Club encampment in the District of Columbia. Institutes were held for 69 groups of club leaders and at two State conferences and one interstate conference of county agents. In all, about 13,000 persons were assisted in planning and carrying out programs of group play that could be carried back to their own communities. Because the time spent in the different States is promised more than a year ahead, it was necessary to refuse requests of 10 additional States for assistance in their rural-recreation program.

The report on rural recreation in West Virginia has been completed, and it will go to press in 1931.

DEPENDENT AND NEGLECTED CHILDREN

During the past year special assistance has been given by the bureau in Ohio, South Carolina, Maryland, Illinois, and Louisiana in connection with the administration of laws providing for public aid to dependent children, often known as mothers' assistance or mothers' pension laws. There is much interest at present in the subject of State grants-in-aid for mothers' pensions. In Illinois, where the method of distribution of a State grant was left to the State department of public welfare by the law enacted in 1929, the bureau assisted the department and the Illinois Committee on Child Welfare Legislation in formulating a plan which utilizes in this field the experience of the States with the State equalization funds for education. Under this plan, an estimate was made of the probable number of children for whom aid would be required in each county and the unit cost for reasonably adequate aid in Illinois. This plan involved the division of the State appropriation into two funds. From one of these, each county meeting a minimum standard of expenditure and administration was to receive a grant based on its population. To

those counties whose estimated needs are found to be greater than can be met from the returns of the maximum tax permitted by statute, sufficient moneys to meet their deficit would be allotted from the second fund, so far as the limitations of the law permit.

Work on the mothers' aid manual has continued. Portions have been submitted to specialists in the field, from whom valuable suggestions have been received.

Plans have been completed for a cooperative study, to be made by the Children's Bureau and the Council of Social Agencies of Minneapolis, of the public and private relief agencies of that city. Special attention will be given to the problems of dependent families in receipt of relief, including those receiving mothers' aid.

CURRENT CHILD-WELFARE STATISTICS

Trend of child labor.

The industrial division has continued the work of collecting and analyzing current reports of employment certificates issued to children, which has been carried on since 1920. The child-labor laws of nearly all States require children under certain ages who wish to go to work to obtain such certificates, in most States from some local official (usually the school superintendent or a person appointed by him), but in some States from a representative of the State department of labor, education, or child welfare. If accurately kept, the records of these certificates give the number of children going to work in each State in the occupations for which certificates are required. They not only furnish practically the only source, between the years of the decennial census, of general and comparable information indicating the trend in the employment of children but also contain information not obtainable elsewhere, on other important aspects of child labor.

When the bureau first directed its attention to the availability of these statistics, it was found that comparatively few places had recognized the value of obtaining and keeping such records of certificates as would readily yield this type of information for the young workers of the State or the community, and that even where records were well kept the information in one office was often not comparable with that in another, so that the figures from the different States could not be combined. Efforts have therefore been directed, at first through correspondence and later also through visits by a representative of the bureau, toward obtaining cooperation from State and local officials responsible for the issuance of employment certificates, as well as from State officials supervising and receiving reports of certificate issuance, in getting and reporting this information in a way that would permit comparison.

Forms for recording these statistics have been prepared by the bureau, and visits have been made to local and State offices to obtain their cooperation in the use of these forms and to consult with them as to the methods of recording and compiling certificate statistics best adapted to their convenience. Suggestions have been made for office procedure and for the recording of statistics so as to obtain not only uniform and comparable reports from different localities but

also, in addition to the figures showing the number of children receiving permits, significant facts concerning the age, sex, education, and kinds of employment of the working children.

In States where the child labor law does not require local issuing officers to make reports to any State official or where for other reasons, such as the incompleteness of reports from local offices, the practice of compiling all statistics on a fiscal-year basis, or an inadequate office force, it has not been possible to obtain statistics for the entire State, attempts have been made to obtain reports from the larger cities in the State.

For 1926, the first year in which personal visits to State and local offices were made, the bureau received reports from only 12 States, 26 cities in 12 other States, and the District of Columbia, whereas for 1929 it received reports from 19 States, 65 cities in 15 other States, and the District of Columbia.

It is estimated on the basis of the 1920 census that the number of 14 and 15 year old children receiving certificates in the States and cities from which reports are now being received represents approximately 70 per cent of the 14 and 15 year old children in the United States going to work in occupations for which certificates are usually required under the State child-labor laws. These records, of course, do not include the large number of children entering occupations (such as agricultural pursuits and domestic service) for which certificates are not required under State laws, nor those going to work illegally. It should be remembered also, that the number of first regular certificates issued does not indicate the total number of children at work at any given time but only the number beginning work during a single year. These figures are, however, representative of conditions as regards at least the legal employment of children of employment-certificate age in most industrial and commercial pursuits in the important child-employing centers.

A special attempt has been made to obtain, in addition to the figures for the number of children receiving certificates, as comprehensive data as possible showing the age and sex of the workers, the school grade completed before they go to work, the character of the evidence accepted as proof of their ages, and the industries that they enter. Though most permit-issuing offices have staffs so small as to preclude the possibility of keeping elaborate records, 44 local offices and 9 State departments, furnishing reports on the number of 14 and 15 year old children going to work during the calendar year 1929, have supplied supplementary data on all these points, and nearly all the offices reporting have given at least some of this information.

The reports received for 1929 have been tabulated for all except two States[1] and for cities with a population of 50,000 or over, where 137,786 children 14 and 15 years of age and 82,301 children 16 and 17 years of age received regular certificates for the first time in 1929.[2] Of the 220,087 certificates 199,282 were reported to have been

[1] These States are Alabama and Oklahoma, the figures for which could not be tabulated because they did not show the number of first regular certificates separately from the number of reissued certificates.

[2] In addition, reports were received from a number of cities of less than 50,000 population, as follows: Eleven cities in California, 2 in Oregon, and 1 in Ohio showed a total of 54 first regular certificates issued to 14 and 15 year old children, while the same California cities, 3 cities in Ohio, and 3 in Oregon reported a total of 1,811 regular certificates issued to minors 16 and 17 years of age.

issued to children who were released from full-time school attendance for employment. The remaining 20,805 were issued to children in States and cities in which regular certificates are issued for work during vacation and outside school hours. Some of these 20,805 certificates, therefore, were undoubtedly issued to children who did not leave school but worked only after school hours or when school was not in session.

TABLE 1.—*Number of children 14 and 15 years of age receiving regular employment certificates for the first time in 1928 and 1929 and per cent of increase or decrease, as compared with the previous year, in States and in cities of 50,000 population and over that reported*[1]

[1] Population according to census estimate of July 1, 1928, or where no estimate was made, according to census of 1920. Figures from State or local official sources.

[2] Per cent not shown where number of children is less than 50 nor where figures for previous year are not available.

[3] Includes children to whom regular certificates were issued for work outside school hours and during vacation.

[4] Number of 15-year-old children to whom regular certificates were issued; law does not permit the issuance of regular certificates to children under 15. In Grand Rapids, Mich., in 1929 a regular certificate was issued to one child of 14 years for work on a farm; in Hamtramck, Mich., in 1928 regular certificates were issued to two children of 14 years and in 1929 to three children of 14 years, after investigation disclosed necessity for employment; in Lansing, Mich., in 1929 regular certificates were issued to one child of 14 years compelled to support himself and to three children of 14 years enrolled in the high-school industrial course and working part time.

[5] Exclusive of 211 children in 1928 and 213 children in 1929 to whom "vocational" certificates were issued.

[6] Revised figures supplied by State.

[7] Includes in New Hampshire children to whom regular certificates were issued for "after-school" work, and in San Diego in 1928 children to whom certificates were issued for work outside school hours which were not reported separately.

[2] Per cent not shown where number of children is less than 50 nor where figures for previous year are not available or not comparable.

[3] Number of 16-year-old children to whom regular certificates were issued; law does not require certificates for children over 16 years.

[4] Includes children to whom certificates were issued for work outside school hours but which were not reported separately.

[5] Number of girls to whom regular certificates were issued; law does not require certificates for boys of these ages.

[6] May include some children working part time to whom regular certificates were issued.

[7] Includes children to whom regular certificates were issued for work outside school hours and during vacation.

The number of 14 and 15 year old children to whom first regular certificates were issued increased 5 per cent in 1929 over 1928 in the 14 States and the District of Columbia and the 49 cities in 15 other States, for which comparable figures are available. In many of these

places—7 States and 22 cities in other States—the increases in 1929 followed decreases in 1928 as compared with 1927, but in 3 States, 6 cities, and the District of Columbia both years showed an increase. In the States and cities for which comparable figures are available for 1927, as well as 1928 and 1929, the number of 14 and 15 year old children to whom regular certificates were issued increased 6 per cent in 1929 over 1928, whereas in 1928 there was a decrease of 7 per cent as compared with 1927.

That the increases in 1929 occurred very largely during the first seven months of the year is shown by monthly figures obtained from 3 States and 18 cities in 11 other States reporting such increases. During the last five months of 1929 more than half these localities reported decreases from the corresponding period in 1928, which might indicate that the number of jobs available for young workers was considerably reduced because of the slackening of business during the latter part of 1929.

In the States and cities reporting a decrease in 1929 as compared with 1928, changes in the laws raising educational standards for children going to work and more rigid enforcement of the child labor and compulsory school attendance laws were probably factors in keeping children in school and thereby reducing the number of 14 and 15 year old children going to work.

In States requiring the issuance of certificates to children 16 or 17 years of age, or both, reports of employment certificates issued in 1929 were received from 3 States, 26 cities in other States, and the District of Columbia. For the group of States and cities reporting in both years, there was an increase of 22 per cent in the number of certificates issued to children of this age group in 1929 as compared with 1928, following the same trend in 1928 as compared with 1927. For the States and cities for which comparable information is available for the 3-year period, the increase, however, was greater in 1929 than in 1928, amounting to 21 per cent in 1929 over 1928. as compared with only 8 per cent in 1928 over 1927.

All the States for which figures for individual cities or for the entire State are given in Table 1 require a child to be at least 14 years of age before a regular employment certificate may be issued to him; among these are three States which fix the minimum age at 15, while in one State a child of normal intelligence must be at least 16 before he may receive his first regular certificate. The reports for 1929 show that 33 per cent of the 107,307 children for whom records are available started to work when they were 14 years of age. In 3 of the 15 States and in 4 of the 47 cities in 17 other States furnishing data regarding age, more than half the certificates for first regular employment were issued to 14-year-old children. In the States and the cities in States having a law requiring the completion of the eighth grade, without provision for exceptions, before a 14-year-old child could secure a certificate, the percentage of children going to work as young as 14 varied from 1 to 49, and for the whole group was 22.

The number of boys to whom certificates were issued exceeded the number of girls in each age group in most of the places reporting. In these localities certificates were issued to 74,447 boys as compared with 62,230 girls 14 and 15 years of age, and to 44,257 boys as compared with 38,019 girls 16 and 17 years of age.

Reports of regular certificates issued to 14 and 15 year old children received from 9 States, 43 cities in 18 other States, and the District of Columbia gave separate figures for white and colored. In these places the number of colored children was 1 per cent of the total number to whom first regular certificates were issued, though the proportion of colored children 14 and 15 years of age in the United States is 12 per cent.[3] This does not approximate the true proportion of white and colored children entering employment in 1929, as colored children are frequently employed in domestic and personal service, and in farm work, for which certificates are usually not required.

The educational requirement for the issuance of employment certificates to minors under 16 is usually the completion of a certain grade, ranging from the fifth to the eighth in the States from which the bureau obtained information on this subject. Four States (Indiana, Maine, Minnesota, and Wisconsin) and the city of Portland, Oreg., reported that 100 per cent of the children had completed the eighth or a higher grade; the District of Columbia, 5 States, and 17 cities in 7 other States showed that from 56 to 96 per cent of the children had completed at least the eighth grade when they were released from school attendance to enter employment; whereas 4 States and 7 cities reported that from 30 to 71 per cent had completed only the sixth or a lower grade.

In most States the child labor law fixes no educational requirement for minors 16 and 17 years of age obtaining work permits; in Ohio, however, completion of the seventh grade is required. Reports concerning grade completed were received from the District of Columbia, 1 State and 20 cities in 7 other States, all of which reported that a large majority of these older children had completed the eighth grade before they were certificated for regular employment. The proportion of the girls and of the boys who completed the eighth grade was approximately the same in both age groups.

The distribution in the various occupation groups of children to whom work permits are issued is affected by the predominance of different industries in the different localities and by variations in the occupations to which the child labor law applies. Information regarding the occupations for which 41,181 children 14 and 15 years of age received their first regular certificates was furnished by 11 States, 51 cities in 20 other States, and the District of Columbia. Reports from 10 of these States and 24 of the cities showed that the largest proportion of children entered manufacturing and mechanical industries; the District of Columbia and 11 cities showed the largest proportion of young workers entering mercantile occupations; in 8 cities the largest number of children received certificates for domestic and personal service; and in 1 State and in 5 cities public messenger and delivery service provided more jobs for the 14 and 15 year old children than any other group of occupations.

Of the 21,971 boys 14 and 15 years of age for whom information concerning occupation was received, 34 per cent were first employed in manufacturing and mechanical work, 27 per cent entered mercantile establishments, 24 per cent entered public messenger and de-

[3] Fourteenth Census of the United States, 1920, vol. 2, Population, p. 162. Washington, 1922.

livery service, and the remaining 15 per cent went into office work, domestic and personal service, and miscellaneous jobs. A much larger proportion of the 16,444 girls than of the total number of boys (54 per cent as compared with 34 per cent) started to work in manufacturing and mechanical occupations; 19 per cent entered mercantile work and 18 per cent were engaged in domestic and personal service. A slightly larger proportion of girls than of boys secured jobs in offices, and a very small number of girls were employed in messenger service.

For the 16 and 17 year old minors manufacturing and mechanical work predominated in 1 State and in 17 cities, domestic and personal service in 4 cities, and mercantile occupations in the District of Columbia and 1 other city. The largest proportion (44 per cent of the 16,326 boys and 34 per cent of the 13,225 girls) of this upper age group found employment in the manufacturing and mechanical occupations, and the second largest percentage of the boys and of the girls (21 per cent and 26 per cent, respectively) entered trade. The third largest group of boys (16 per cent) went into public messenger and delivery work, while the third largest group of girls (23 per cent) obtained jobs in domestic and personal service.

The types of evidence which were accepted as proof of age for first regular certificates issued to 14 and 15 year old children were reported for 101,434 children in 11 States, 47 cities in 18 other States, and the District of Columbia. Of these children 90,762 (89 per cent) gave as evidence birth certificates or baptismal records. These include 90 per cent or more of the total number in 4 States and in 13 cities in 7 other States; from 75 to 90 per cent in 3 States, 6 cities in 4 other States, and the District of Columbia; and less than 75 per cent in the remaining States and cities for which this information was received. These two kinds of evidence were accepted in 8 cities as proof of age for less than 10 per cent of all their certificated cases, and in 2 States and 7 cities neither a birth certificate nor a baptismal record was presented as evidence for the issuance of a single employment certificate.

Juvenile-court statistics.

The cooperation of juvenile courts and State departments of social welfare with the Children's Bureau in its plan for uniform reporting of juvenile-court statistics increased steadily during the year. Ninety-six courts reported for the calendar year 1929, as compared with 65 courts for 1928 and 43 for 1927. The statistical cards which had been in use since July 1, 1926, were revised, the new cards being distributed at the beginning of the calendar year. In order to extend the reporting of juvenile courts on a state-wide basis, the bureau has prepared, after consultation with a number of State departments, a simplified set of report forms adapted to the use of smaller courts. These forms, which consist of a set of daily sheets, a monthly report sheet, and yearly summary sheets, will be tried out during 1931 by several State departments having authority to require reports from the juvenile courts of the State. It is expected that courts serving populations of 100,000 or more will continue to report directly to the bureau on cards, and that the courts serving populations of less than 100,000 will report monthly or annually to the State department, which in turn will make an annual report to the

bureau. Comparable statistics will then be available for the whole reporting area, with greater detail for the larger communities.

During the calendar year 1929, 46,312 delinquency cases, 18,805 dependency and neglect cases, and 10,493 cases of children discharged from supervision were reported to the Children's Bureau by the courts from which figures were received for the entire year. The populations of the areas served by the courts varied from less than 25,000 to 100,000 or more in 1920. Thirty of the courts served populations of 100,000 or more (the court serving the largest population was that of New York City), 49 populations of 25,000 to 100,000, and 17 populations of less than 25,000. Eighty-nine per cent of the delinquency cases and 85 per cent of the dependency and neglect cases were reported by courts coming within the first group. Table 3 shows the number of cases of each type reported by cooperating courts.

Although the reasons for referring delinquent children to court and the methods of dealing with them differ somewhat from court to court, the per cent distribution figures for all courts reporting in each of the three years 1927, 1928, and 1929 show only minor differences. This similarity is found, also, with respect to sex, age, and social characteristics of the children concerned. That the data are so similar, in spite of the increase in the number of reporting courts and the number of cases reported, suggests that the uniform reporting of juvenile-court statistics has made available information fairly representative for the United States regarding the nature of the problems dealt with by the juvenile court, the sex, age, and social characteristics of the children involved, and the extent to which certain types of treatment are used. The tracing of trends or changes in the nature of the problems dealt with and in the methods of dealing with them will also be possible.

As is shown by the following table, giving the per cent distribution according to the reasons for which children were referred to court during each of the three years, "stealing" and "acts of carelessness or mischief" are the chief reasons for referring boys' cases, and the closely related offenses "running away," being "ungovernable," and "sex offense" are the chief reasons for referring girls' cases.

TABLE 4.—*Per cent distribution, according to reason for reference to court, of boys' and girls' delinquency cases disposed of during 1927, 1928, and 1929, by juvenile courts reporting statistics to the Children's Bureau*[1]

[1] 42 courts reported delinquency cases in 1927, 62 in 1928, and 93 in 1929.

Tables 5 and 6 show the per cent distribution by color and nativity of child and by nativity of parents for each of the three years.[4] Colored boys are involved in about one-seventh and colored girls in about one-fifth of the delinquency cases dealt with by courts reporting. The question has been raised whether differences exist in the types of offenses committed by colored and white children and in the treatment of these children by the courts. Delinquency, in proportion to population, is more prevalent among colored children than among white children, but an analysis of the cases reported by the courts for 1929 showed that with reference to the offenses committed

[4] Figures for 1927 and 1928 are based on children, each child being counted only once during the year; figures for 1929 on cases.

and the methods by which their cases were disposed of the colored children did not differ in any significant way from the white children. Most of the cases of colored children (69 per cent) were reported by large northern courts, where colored children constituted a small proportion of those coming before the courts.

In less than one-half of the delinquency cases of native-born white girls are one or both parents foreign born. The situation is reversed, however, in the case of native-born white boys who become delinquent. In more than one-half of the boys' cases one or both parents are foreign born.

TABLE 5.—*Per cent distribution, according to color and nativity of children dealt with, in boys' and girls' delinquency cases disposed of during 1927, 1928, and 1929 by juvenile courts reporting statistics to the Children's Bureau* [1]

Total	100	100	100	100	100	100
Native parentage	43	44	48	55	55	61
Foreign or mixed parentage	57	56	52	45	45	39

[1] 42 courts reported delinquency cases in 1927, 62 in 1928, and 93 in 1929.

In 1927 and in 1928 slightly less than three-fourths (73 per cent in 1927 and 72 per cent in 1928) and in 1929 about two-thirds (69 per cent) of all delinquency cases were dealt with officially. According to Table 7, which shows the per cent distribution in cases so handled for each of the three years, probation is the treatment most frequently used both in boys' and in girls' cases. Dismissal or indefinite continuance is used more often in cases of boys than in those of girls, probably because a larger proportion of minor cases are referred for boys than for girls. The difference in procedure with

regard to institutional commitments in boys' and in girls' cases is rather striking, the percentage of such commitments being much higher in girls' cases.

TABLE 7.—*Per cent distribution, according to dispositions, of boys' and girls' official delinquency cases disposed of during 1927, 1928, and 1929 by juvenile courts reporting statistics to the Children's Bureau* [1]

Disposition	Delinquency cases					
	Boys' cases			Girls' cases		
	1927	1928	1929	1927	1928	1929

Other	4	6	7	8	9	11

[1] 42 courts reported official delinquency cases in 1927, 61 in 1928, and 87 in 1929.

The complete statistical report for 1929, which is to be published shortly, will contain general tables summarizing data for all cases reported and source tables giving data for individual courts in the larger cities, grouped according to those serving populations of 100,000 or more and those serving populations of 25,000 to 100,000.

Other current statistics.

Plans were completed during the year under review for the bureau to take over July 1, 1930, the registration of social statistics in 39 cities, which during the last two years has been a joint project of the local community research committee of the University of Chicago and the National Association of Community Chests and Councils. The community chests and councils will continue to assemble the data, which will be tabulated and analyzed in the Children's Bureau. There are many social and statistical problems to be worked out before comparable statistics in dependency, delinquency, and other fields of interest in social planning can be secured. The bureau expects to receive much assistance in working out these problems from the joint committee which initiated this plan and which will be continued with some changes as an advisory committee to the bureau.

LEGISLATION RELATING TO CHILDREN

During 1930 regular legislative sessions were held in nine States—Kentucky, Louisiana, Massachusetts, Mississippi, New Jersey, New York, Rhode Island, South Carolina, and Virginia—and special sessions in a few other States, including Kansas, Maine, Nebraska, New Hampshire, Utah, and Texas. Legislative material has been received by the Children's Bureau from the majority of these States.

Child hygiene and public health.

A New Jersey law requires the county superintendents of schools to apportion school moneys to districts employing registered nurses. New York has authorized county boards of supervisors to employ

dental hygienists and clinic physicians, and has eliminated from the law providing for State aid to counties for health work the clause prohibiting such aid for health work done by county authorities in a city of more than 50,000 inhabitants. Another New York act provides for public-school cafeteria or restaurant service. The name of the child-welfare division of the Rhode Island Public Health Commission has been changed to the child-hygiene division and the law requiring registration of vital statistics has been amended slightly. A new Virginia law requires the approval of the State board of education and the State health commissioner for suspension of any of the provisions of the compulsory-vaccination requirements.

New York bills not enacted into law include one to create a maternity commission to examine the laws of the State with a view to inquiring into the possibility and feasibility of increasing State aid—financial, medical, and educational—so that deaths due to childbirth may be reduced; and a bill vetoed by the governor to establish a county dental health department in Monroe County.

Child labor and compulsory school attendance.

Measures relating to legal standards affecting the employment of children, either directly or through requiring attendance at school, were enacted by the States of Mississippi and New Jersey. Mississippi passed two laws relating to compulsory school attendance and child labor, one prohibiting the employment of a child between 14 and 16 years of age in any factory or workshop unless he has complied with, or is complying with, the compulsory school attendance law, and the other requiring attendance for the full school term, instead of for only 80 days, in municipal separate school districts having a population of 10,000 or more. The New Jersey Legislature passed a joint resolution for the creation of a commission of three persons, consisting of representatives or members of the State department of labor, the State board of agriculture, and the commissioner of education, to investigate the employment of migratory children in the State and to submit a report to the next legislature.

In Louisiana the maximum hours of labor for girls 16 years of age and over are reduced from 10 hours per day and 60 per week to 9 per day and 54 per week, except for girls working in stores on Saturday nights, but exemptions are made permitting a 10-hour day and 60-hour week in stores and restaurants in small places, in telegraph offices, and in fruit, vegetable, and fish canneries. The same law, however, removes the former limitation of a maximum 10-hour day and 60-hour week for boys 16 and 17 years of age.

Reports have been received of a number of attempted advances in the standards of State child labor and compulsory school attendance laws which failed of enactment, but information with regard to such bills is incomplete. The unsuccessful proposals of this type reported to the bureau are: In Kentucky a bill to shorten the hours of labor of girls and women; in New York a bill raising the minimum age for employment during school hours to 15; in Massachusetts a proposal to raise the minimum age for employment to 15 and the grade requirement from completion of the sixth to completion of the seventh grade; and in New Jersey a revision of the school code which would require children 14 years of age to have completed the

eighth grade (instead of only the sixth) before leaving school for work. Bills strengthening the provisions for vocational counsel and guidance of unemployed children in New York and Rhode Island also failed, and in Rhode Island an amendment to the compensation law, which would have provided double or treble compensation for minors injured while illegally employed, died in committee.

A few reports have been received of bills attempting to lower existing standards, which failed to pass. These are: Proposals to allow a longer working week for women and girls over 16 in certain employments in Massachusetts; to weaken the requirements for attendance at continuation school in New York; and to lower the standards of the compulsory school attendance law in South Carolina.

Dependent children.

Louisiana passed a comprehensive mothers' aid law, repealing existing laws on the subject. The new act provides for the appointment of local boards of trustees of the children's aid fund in parishes (and the city of New Orleans) which accept the provisions of the act to receive and investigate applications, grant allowances, and supervise persons receiving aid. Provision is also made for a State children's aid board and a State supervisor to advise and direct local boards in the administration of the act. The law authorizes State aid to parishes and the city of New Orleans which appropriate sums to carry out the act, and the legislature of 1930 appropriated $200,000 for the biennium beginning July 1, 1930, for this purpose. Two amendments to the New York act authorizing aid to mothers with dependent children permit such aid to be given to a deserted wife whose husband has been away two years instead of five as previously required, and to a relative within the second degree when the mother is dead or is permanently incapacitated and confined in an institution for the care of her ailment.

Earnings of prisoners in New York may be paid to their dependents by virtue of an amendment to the law relative to prisoners' earnings. Both New York and Virginia have provided for the care and disposition of young children of women prisoners born during or before the mother's term of imprisonment. A New York law requires adequate medical and nursing care of a woman confined in a public home and about to give birth to a child, and a Rhode Island act provides for notice to the State public-welfare commission of deaths in maternity hospitals.

South Carolina created an independent State children's bureau and transferred to it all the powers and duties heretofore exercised by the child-placing bureau of the State board of health. In New York the sections of the State charities law relating to the care of dependent, neglected, and delinquent children, which were inadvertently repealed by the public welfare law of 1929, were reenacted. County boards of supervisors in Virginia were authorized to contract with licensed incorporated charitable corporations for the care and maintenance of dependent children and to make appropriations to such organizations.

Porto Rico created a special commission composed of the commissioner of health, the commissioner of the interior, and the commissioner of agriculture and labor. The commissioner of health is

directed to take a census of all neglected, homeless children in the island, whether orphans or not. In accordance with this census, the commissioners of the interior and of agriculture and labor are to make surveys and prepare plans for the construction of an agricultural farm where such children may live and receive training in trades and in the cultivation of the soil. The commission is to report to the legislature at its next regular session.

Children born out of wedlock.

Massachusetts amended the law relating to the correction of birth records of children born out of wedlock who have acquired new names by judicial decree or by the intermarriage of the parents and acknowledgment by the father. The New York statute (applying only to New York City) for the establishment of paternity and support was amended, the more important amendments including changes affecting procedure, defining the support obligation, granting to the court the additional power to order support of a child until 21 years of age or longer, and changing the term "child born out of wedlock" to "natural child."

Adoption and guardianship.

Rhode Island changed its adoption law to provide that petitions for adoption are to be made to the court of the town in which the petitioner resides, instead of the town in which the child resides. Virginia made the mother and father of legitimate unmarried minor children their joint natural guardians, with equal pertinent rights and powers, and upon the death of either parent the survivor is entitled to the exclusive custody and guardianship of such children.

Juvenile and domestic-relations courts and juvenile delinquency.

Laws relating to juvenile and family courts and to youthful offenders were enacted in a few States. New Jersey gave to family courts jurisdiction over cases in which relatives are compelled to contribute to the support of poor persons. New Jersey also provided for the complete removal, upon certain conditions, of disqualifications resulting from conviction of crime, if the conviction took place while the person was under 20 years of age. A New York act authorizes the State department of social welfare to study the causes of juvenile delinquency and other problems of social welfare and to collect and disseminate information in relation thereto. The New York State children's court act and the special Syracuse children's court act were amended so as to remove ambiguous language. Under both acts the court is now also given jurisdiction over any child over 16 years of age if the offense charged was committed by the child when he was under 16, and the jurisdiction obtained by the courts in case of any child continues until the child reaches the age of 21 if not discharged before then. New York also clarified the powers and duties of the State director of probation in relation to children's courts and empowered him to collect information and make recommendations regarding the administration of probation in these courts. Another amendment requires probation officers to investigate the circumstances responsible for a child's appearance in court.

New Jersey passed the bill sponsored by the National Crime Commission regulating the sale and possession of firearms. In New York

the governor vetoed a bill to establish a division of child guidance in the New York City bureau of compulsory education and to provide for an additional assistant director.

Physically handicapped children.

The New Jersey Crippled Children's Commission, created in 1926, was continued with an appropriation of $5,000. A Virginia act permits counties or cities in which six or more blind children are found to establish special classes in the public schools for such children. A Federal bill to provide free medical and surgical aid to crippled children in the United States under 21 years of age was referred to a congressional committee, but has not been reported out by the committee.

Mentally defective children.

The Congress of the United States enacted a law to establish a hospital for defective delinquents. The Virginia colony for epileptics and feeble-minded, formerly open to feeble-minded white persons of any age, was restricted to epileptic white persons not under 10 and feeble-minded white females of child-bearing age not under 10 nor over 45 and white males not under 10. New Jersey changed the name of the State institution for feeble-minded women to the Vineland State School.

Recreation.

New York extended the law requiring licenses for the operation of dance halls in towns outside of incorporated villages to include those halls operated or maintained by firms, associations, or corporations and specified the penalty for violations. Virginia included sound and dialogue motion pictures within the supervision of the division of motion-picture censorship in the State department of law.

STATE CHILD-WELFARE COMMISSIONS

State commissions for the study and revision of child-welfare or social-welfare legislation have been active during the past year in California, Illinois, Maryland, Massachusetts, and Wyoming.[5]

The California Commission for the Study of Problem Children, authorized by the legislature of 1927 and continued in 1929, has been preparing a comprehensive report dealing with various aspects of the problems of juvenile maladjustment. At a public conference held in conjunction with the State conference of social work in May the commission presented two programs, one dealing with proposals for a State recreational program and the other with the problems of the psychopathic or defective delinquent. The commission is cooperating with the California Bureau of Juvenile Research on a number of projects.

The Illinois Committee on Child Welfare Legislation, authorized by legislation of 1929, has been organized and the work divided among subcommittees dealing with (1) dependency, (2) delinquency, (3) defective children, (4) health and education, and (5) the county unit. An executive secretary has been employed. The commission has arranged a number of conferences and has been engaged in an

[5] A commission was created in Oklahoma after the close of the fiscal year.

analysis of the laws of Illinois and of other States on certain subjects and in a comprehensive study of the children's problems of the State.

The Social Welfare Survey Commission of Maryland, appointed in 1929, has held many meetings and given particular attention to State and county welfare organization and the administration of mothers' pensions.

The Massachusetts commission, also appointed in 1929 but for one year only, was continued by the recent session of the legislature for another year. At this session, also, the commission was authorized to obtain data for and otherwise cooperate with the White House Conference on Child Health and Protection. The commission has drawn up a very comprehensive outline of topics for study, covering the entire field of child welfare. A number of public hearings have been held in various cities of the State on different subjects, field and consultant service has been employed, and special emphasis has been given to legal research.

The Wyoming Committee on Child Welfare, appointed by the governor in 1928, has been studying means of reducing the absence from school of Mexican children for work in the beet fields and has also been considering legislation to be recommended to the legislature of 1931 relating to the employment of trained social workers by counties or judicial districts.

COOPERATION WITH STATE AGENCIES

The bureau has continued, as in previous years, to cooperate, when requested, with the various State agencies charged with responsibility for the care and protection of children. The study of maternal mortality made in cooperation with the State departments of health has been referred to.

With increasing public provision for the treatment and prevention of dependency and delinquency, interest in the efficient functioning of State and local agencies has increased. As in the health field, the county is being increasingly used as the local administrative unit, and the coordination of all social services for children and families is being accomplished by the consolidation of all these services under trained leadership. The bureau has endeavored to keep current its reports on these developments, and in its investigation of administrative practice in 10 representative State departments of social welfare the State-county relationship has been especially studied. The field work in this investigation has been practically concluded in six States. Completion of the field work has been delayed in order to put into shape for the use of the White House Conference on Child Health and Protection the material the bureau has assembled on this whole subject.

At its request the Massachusetts Special Commission on the Laws Relative to Children has been given assistance on various aspects of child welfare laws, which has required special legal research. This material will be used by the commission in its analysis of the existing laws of the State and in the formulation of recommendations for legislation. Plans are under way for the bureau to assist the Illinois Committee on Child Welfare Legislation, authorized by the legislature in 1929, in studying some of the present provisions of the State

for the care of children. As part of this investigation a study of State welfare activities has been begun, at the request of the State department of public welfare. A second piece of work which has also been started is a study of the administration of mothers' aid in five counties, selected so as to represent differing conditions with respect to social resources, wealth, and population. In order to determine the actual care being given to children in various parts of the State, study of activities for children in a few counties will be undertaken by the Children's Bureau early in the fall.

THE WHITE HOUSE CONFERENCE ON CHILD HEALTH AND PROTECTION

In July, 1929, the President appointed a planning committee for a White House Conference on Child Health and Protection. Working committees and subcommittees were organized in the early autumn in the following fields: I. Medical service; II. Public-health service and administration; III. Education and training; and IV. The handicapped—prevention, maintenance, protection. The Secretary of Labor is vice chairman of the conference, and the Chief of the Children's Bureau is a member of the planning committee and secretary of the executive committee. Division directors and members of the bureau staff are serving on committees in all four major divisions of the conference. The bureau has postponed, when possible, work already under way in order to respond to requests received from all the various committees for material. The assistant chief of the bureau has served as research secretary of the delinquency committee of Section IV, and in this capacity has attended all committee meetings, assisted in planning the surveys to be made, and supervised the conference staff of this committee. The director of the statistical division has served as a member of the committee on growth and development and of the committee on medical care for children and as statistical adviser to the committee on prenatal and maternal care, which are committees of Section I. Besides attendance at committee meetings this has meant the review and criticism of questionnaires sent out by the committee on prenatal and maternal care and the supervision of their tabulation. Two reports are being prepared in the statistical division; one on the comparability and trend of maternal, infant, and neonatal mortality and stillbirth rates in the United States and certain foreign countries, and the other, a statistical evaluation and summary of the literature on socio-economic factors influencing growth and development. The bureau's consultant in obstetrics is chairman of the committee on midwives. The director of the child-hygiene division is on the committee on growth and development of Section I. It is regretted that with all the other demands it has not been possible to accede to the request of the chairman of this committee and of the section to tabulate and analyze for the conference some of the growth material secured in connection with the series of examinations made in the New Haven rickets study.

The director of the social-service division has given much time to attendance at the committee meetings of the subdivision on National, State, and local public and private agencies of Section IV and the

planning of surveys that have been made by this committee. In order to meet the requests for information on child-welfare legislation two additional persons were employed in the social-service division for legal research, and material has been prepared on the subject of State administrative provisions for the care of handicapped children and on mothers' allowances.

The director of the industrial division is serving as chairman of the section on child labor of the committee on vocational guidance and child labor of Section III and is directing the research and compilation of information for the use of the various subcommittees of this committee. The industrial division is also cooperating, through preparation of forms and analyses of returns, in an inquiry which the committee is making into occupations, hours of labor, and wages of employed children.

In addition to work for the child-labor section of the committee the industrial division of the bureau is assisting the vocational-guidance section by bringing up to date the report on Vocational Guidance and Junior Placement in 12 cities, published by the bureau in 1925 in cooperation with the junior division of the Employment Service of the Department of Labor.

The work of all these committees and subcommittees will be embodied in a report to the conference, which will meet in November, 1930. The first White House conference, assembled by President Roosevelt in 1909, recommended the creation of the Children's Bureau, and this recommendation was transmitted to Congress with their indorsements by both President Roosevelt and President Taft. At the request of President Wilson a Conference on Minimum Standards of Child Welfare was assembled by the Children's Bureau in 1919. The conference that will meet in 1930 reflects in its organization the general conclusion of the first conference, which was that there should be a national agency surveying and coordinating the interests of the child as a whole. The work of the 1930 conference should make a great contribution to national understanding of the related problems of childhood.

EXHIBITS AND RADIO TALKS

During the year 1,117 shipments of exhibit material were sent to National, State, and local organizations to aid them in their efforts to bring child-welfare problems to the attention of the public.

The League for the Prevention of Infant Mortality of Pernambuco, Brazil, ordered from the United States a considerable amount of exhibit material, which was prepared under the supervision of the Children's Bureau. The bureau also cooperated with the Rockefeller Foundation, the Near East Relief, the Argentine Association of Social Hygiene, and the Department of Health of Mexico in securing films for foreign child-welfare organizations.

A gold medal was awarded to the Children's Bureau for its exhibit at the Ibero-American Exposition at Seville, Spain (May, 1929–June, 1930).

The series of weekly radio talks by the chief of the bureau, begun in the fiscal year 1929, was continued throughout the past fiscal year.

REPORTS ISSUED, IN PRESS, AND IN PREPARATION

During the fiscal year ended June 30, 1930, 19 new and 4 revised publications have been issued, 3 reports were in press at the close of the year, and 28 were in preparation.

Reports issued:

Seventeenth Annual Report of the Chief, Children's Bureau, 1929.
The Promotion of the Welfare and Hygiene of Maternity and Infancy—The Administration of the Act of Congress of November 23, 1921, for Fiscal Year Ended June 30, 1928. Publication No. 194.
Infant Care (revised July, 1929). Publication No. 8.
Child Labor—Facts and Figures. Publication No. 197.
Child Labor in New Jersey—Part 1, Employment of School Children, by Nettie P. McGill and Mary Skinner. Publication No. 192.
Children in Fruit and Vegetable Canneries; a survey of conditions of work in seven States, by Ellen Nathalie Matthews. Publication No. 198.
Juvenile Court Statistics, 1927, based on information supplied by 42 courts. First annual report. Publication No. 195.
Juvenile Court Statistics, 1928, based on information supplied by 65 courts. Second annual report. Publication No. 200.
Juvenile Delinquency in Maine. Publication No. 201.
Youth and Crime; a study of the prevalence and treatment of delinquency among boys over juvenile-court age in Chicago, by Dorothy Williams Burke. Publication No. 196.

Charts, folders, and leaflets issued:

Causes and Prevention of Neonatal Mortality, by Richard A. Bolt, M. D.
Infant Mortality in the Counties of the United States Birth-Registration States (map), 1923–1927.
Midwifery in Denmark, by Dorothy Reed Mendenhall, M. D.
Prevention of Neonatal Mortality From the Obstetrician's Point of View, by Fred L. Adair, M. D.
Rural Hospitals or Maternities of Canada, by Mrs. Jean T. Dillon, R. N.
Baby's Daily Time Cards (six cards giving daily routine and training for babies from birth to 2 years of age). Revised February, 1930. Chart No. 14.
Your Child's Teeth. Folder No. 12.
First Regular Employment Certificates Issued to Working Children in 1928.
Analysis and Tabular Summary of State Laws Relating to Jurisdiction in Children's Cases and Cases of Domestic Relations in the United States. Chart No. 17.
Case Work Responsibility of Juvenile Courts, by Grace Abbott. (Reprinted from the Proceedings of the National Conference of Social Work, 1929.)
Community Care of Dependent, Delinquent, and Handicapped Children (revised). Folder No. 7.
List of Exhibits, July, 1929.
List of Publications, January 2, 1930.

Reports in press:

Prenatal Care (revised). Publication No. 4.
Are You Training Your Child To Be Happy? Publication No. 202.
Child Labor in New Jersey—Part 3, Wage-Earning Children of Newark and Paterson. Publication No. 199.

Reports in preparation:

Eighteenth Annual Report of the Chief, Children's Bureau, 1930.
The Promotion of the Welfare and Hygiene of Maternity and Infancy—The Administration of the Act of Congress of November 23, 1921, for Fiscal Year Ended June 30, 1929.
Causes of Maternal Mortality.
The Child from One to Six—His Care and Training. (Revised edition of Child Care, Publication No. 30.)
The Incidence of Rickets among Children in Porto Rico.

Reports in preparation—Continued.

The Incidence of Rickets among a Group of Children under Four Years of Age in Washington, D. C.
Relation of Posture to Physical Fitness.
Accidents to Working Children (nontechnical).
Administration of Child Labor Laws (nontechnical).
Children in Canneries (nontechnical).
Children in Industrial Home Work (nontechnical).
First Regular Employment Certificates Issued to Working Children in 1929.
Vocational Guidance and Junior Placement. (Publication No. 149, revised.)
Vocational Opportunities for Minors: Clothing.
Vocational Opportunities for Minors: Milwaukee.
Vocational Opportunities for Minors: Printing.
Work Histories of Young Persons of Subnormal Mentality.
Working Mothers of Philadelphia.
Workmen's Compensation Laws in Relation to Injured Minors.
Adoption Laws in the United States. (Publication No. 148, revised.)
The Child, the Family, and the Court; a study of the administration of justice in the field of domestic relations: Part 2, Organization and Administration of Family Courts in 16 Communities Studied.
Child Welfare in Selected Counties of Washington.
Juvenile-Court Statistics, 1929.
Laws Relating to Interstate Placement of Dependent Children. (Publication No. 139, revised.)
Mothers' Aid Manual.
Recreation in Rural West Virginia.
The Welfare of Children in Families of Maintenance-of-Way Employees.
Work of the Minnesota Children's Bureau.

Charts and folders in preparation:

Infant Mortality in the Counties of the United States Birth-Registration States (map), 1924–1928.
State Laws Regulating the Employment of Minors in Public Performances.
Books and Pamphlets on Child Care (folder).
How to Avoid Harm (folder).
Posture for Preschool Children (folder).
Sunlight for Babies. (Folder No. 5, revised.)

DISTRIBUTION OF PUBLICATIONS

The number of publications distributed during the past year was 1,562,463, an increase of 90,033 over the preceding year. The distribution of popular bulletins on the care of children was as follows in 1929 and 1930:

	1929	1930
Total	832,598	843,075
Prenatal Care	158,583	132,880
Infant Care	432,306	522,517
Child Care	158,637	100,344
Child Management	83,072	87,334

The bulletins on Prenatal Care and Child Care, which are being revised, were available for distribution during part of the year only.

Direct requests from parents for Infant Care were filled, but in order to reserve a supply for the individual parents it was necessary, as in former years, to curtail quantity requests coming from child-welfare organizations, State and municipal departments of health, and Members of Congress. During a 3-month period, when a count

was kept of the number of these popular bulletins and leaflets refused, 410,973 were sent out and, as a result of cutting down quantity requests, 141,987 were refused.

Information as to the sales of popular publications for 1930 is not available. Those for 1928 and 1929 follow:

	1928	1929
Total	264,690	372,233
Prenatal Care	52,468	78,944
Infant Care	119,523	168,569
Child Care	40,860	66,804
Child Management	51,839	57,916

The technical publications are also reaching a wider field, although the policy of restricting free distribution has been adopted by the bureau. Owing to limited editions, mailing lists are circularized before publications are sent. The returns on circularizations have been greater during this year than in previous years, and for one of the publications free copies were available for only about two-thirds of the number of persons returning letters with requests.

The Child-Welfare News Summary was issued 30 times during the past year and sent to a mailing list of approximately 1,000 child-welfare agencies and publications, and persons actively engaged in child-welfare work.

EXPANDING OPPORTUNITIES FOR SERVICE BY THE CHILDREN'S BUREAU

In the preceding pages the work done by the Children's Bureau during the year ending June 30, 1930, has been briefly reviewed. In closing, reference also should be made to what the bureau has not been able to do. More than in any previous year, the bureau has been unable to comply with requests from public and private agencies for state-wide or local investigations, for consultation in the field, for summaries of material in the files of the bureau, and for other kinds of assistance. Postponement in most cases has meant that the bureau has lost an important opportunity to render the kind of service it was created to give.

Reports of the scientific studies of the bureau do not appear as promptly as they should, usually because the statistical and editorial staff is not large enough to do the work promptly. Last year the number of letters received was 140,688, an increase over 1929 of 19,531, which reflects the number of new requests for the year. An increase in the appropriations for 1930 must be devoted largely to the assembling and analysis of current statistics and to special studies of delinquency. Additions to the technical and clerical staff of the bureau should be made to enable it to meet the obligations imposed by the increasing number of opportunities for service.

Respectfully submitted.

GRACE ABBOTT,
Chief.

○
